**On Motion Planning Using Numerical Optimal Control** Kristoffer Bergman,2019-05-28 During the last decades motion planning for autonomous systems has become an important area of research The high interest is not the least due to the development of systems such as self driving cars unmanned aerial vehicles and robotic manipulators In this thesis the objective is not only to find feasible solutions to a motion planning problem but solutions that also optimize some kind of

performance measure From a control perspective the resulting problem is an instance of an optimal control problem In this thesis the focus is to further develop optimal control algorithms such that they be can used to obtain improved solutions to motion planning problems This is achieved by combining ideas from automatic control numerical optimization and robotics First a systematic approach for computing local solutions to motion planning problems in challenging environments is presented The solutions are computed by combining homotopy methods and numerical optimal control techniques The general principle is to define a homotopy that transforms or preferably relaxes the original problem to an easily solved problem The approach is demonstrated in motion planning problems in 2D and 3D environments where the presented method outperforms both a state of the art numerical optimal control method based on standard initialization strategies and a state of the art optimizing sampling based planner based on random sampling Second a framework for automatically generating motion primitives for lattice based motion planners is proposed Given a family of systems the user only needs to specify which principle types of motions that are relevant for the considered system family Based on the selected principle motions and a selected system instance the algorithm not only automatically optimizes the motions connecting pre defined boundary conditions but also simultaneously optimizes the terminal state constraints as well In addition to handling static a priori known system parameters such as platform dimensions the framework also allows for fast automatic re optimization of motion primitives if the system parameters change while the system is in use Furthermore the proposed framework is extended to also allow for an optimization of discretization parameters that are are used by the lattice based motion planner to define a state space discretization This enables an optimized selection of these parameters for a specific system instance Finally a unified optimization based path planning approach to efficiently compute locally optimal solutions to advanced path planning problems is presented The main idea is to combine the strengths of sampling based path planners and numerical optimal control The lattice based path planner is applied to the problem in a first step using a discretized search space where system dynamics and objective function are chosen to coincide with those used in a second numerical optimal control step This novel tight combination of a sampling based path planner and numerical optimal control makes in a structured way benefit of the former method s ability to solve combinatorial parts of the problem and the latter method s ability to obtain locally optimal solutions not constrained to a discretized search space The proposed approach is shown in several practically relevant path planning problems to provide improvements in terms of computation time numerical reliability and objective function value

**Human-in-the-Loop Robot Control and Learning** Luka Peternel, Jan Babič, Erhan Oztop, Tetsunari Inamura, Dingguo Zhang, 2020-01-22

In the past years there has been considerable effort to move robots from industrial environments to our daily lives where they can collaborate and interact with humans to improve our life quality One of the key challenges in this direction is to make a suitable robot control system that can adapt to humans and interactively learn from humans to facilitate the efficient and safe co existence of the two The applications of such robotic systems include

service robotics and physical human robot collaboration assistive and rehabilitation robotics semi autonomous cars etc To achieve the goal of integrating robotic systems into these applications several important research directions must be explored One such direction is the study of skill transfer where a human operator's skilled executions are used to obtain an autonomous controller Another important direction is shared control where a robotic controller and humans control the same body tool mechanism car etc Shared control in turn invokes very rich research questions such as co adaptation between the human and the robot where the two agents can benefit from each other's skills or must adapt to each other's behavior to achieve effective cooperative task executions The aim of this Research Topic is to help bridge the gap between the state of the art and above mentioned goals through novel multidisciplinary approaches in human in the loop robot control and learning

**On-Line Trajectory Generation in Robotic Systems** Torsten Kröger, 2010-02-04 By the dawn of the new millennium robotics has undergone a major transformation in scope and dimensions This expansion has been brought about by the maturity of the field and the advances in its related technologies From a largely dominant industrial focus robotics has been rapidly expanding into the challenges of the human world The new generation of robots is expected to safely and dependably co-habitat with humans in homes workplaces and communities providing support in services entertainment education health care manufacturing and assistance Beyond its impact on physical robots the body of knowledge robotics has produced is revealing a much wider range of applications reaching across diverse research areas and scientific disciplines such as biomechanics haptics neurosciences virtual simulation animation surgery and sensor networks among others In return the challenges of the new emerging areas are providing an abundant source of stimulation and insights for the field of robotics It is indeed at the

intersection of disciplines that the most striking advances happen The goal of the series of Springer Tracts in Advanced Robotics STAR is to bring in a timely fashion the latest advances and developments in robotics on the basis of their significance and quality It is our hope that the wider dissemination of research developments will stimulate more exchanges and collaborations among the research community and contribute to further advancement of this rapidly growing field **IoT and AI in Agriculture** Tofael Ahamed, 2023-04-10 This book reviews recent innovations in the smart agriculture space that use the Internet of Things IoT and sensing to deliver Artificial Intelligence AI solutions to agricultural productivity in the agricultural production hubs In this regard South and Southeast Asia are one of the major agricultural hubs of the world facing challenges of climate change and feeding the fast growing population To address such challenges a transboundary approach along with AI and BIG data for bioinformatics are required to increase yield and minimize pre and post harvest losses in intangible climates to drive the sustainable development goal SDG for feeding a major part of the 9 billion population by 2050 Society 5.0 SDG 1.2 Therefore this book focuses on the solution through smart IoT and AI based agriculture including pest infestation and minimizing agricultural inputs for in house and fields production such as light water fertilizer and pesticides to ensure food security aligns with environmental sustainability It provides a sound understanding for creating new knowledge in line with comprehensive research and education orientation on how the deployment of tiny sensors AI Machine Learning ML controlled UAVs and IoT setups for sensing tracking collection processing and storing information over cloud platforms for nurturing and driving the pace of smart agriculture in this current time The book will appeal to several audiences and the contents are designed for researchers graduates and undergraduate students working in any area of machine learning deep learning in agricultural engineering smart agriculture and environmental science disciplines Utmost care has been taken to present a varied range of resource areas along with immense insights into the impact and scope of IoT AI and ML in the growth of intelligent digital farming and smart agriculture which will give comprehensive information to the targeted readers **The 2005 DARPA Grand Challenge** Martin Buehler, Karl Iagnemma, Sanjiv Singh, 2007-09-06 The DARPA Grand Challenge was a landmark in the field of robotics a race by autonomous vehicles through 132 miles of rough Nevada terrain It showcased exciting and unprecedented capabilities in robotic perception navigation and control The event took place in October 2005 and drew teams of competitors from academia and industry as well as many garage hobbyists This book presents fifteen technical papers that describe each team's driverless vehicle race strategy and insights As a whole they present the state of the art in autonomous vehicle technology and offer a glimpse of future technology for tomorrow's driverless cars Spatial Temporal Patterns for Action-Oriented Perception in Roving Robots Paolo Arena, Luca Patanè, 2008-12-19 The basic principles guiding sensing perception and action in bio systems seem to rely on highly organised spatial temporal dynamics In fact all biological senses visual hearing tactile etc process signals coming from different parts distributed in space and also show a complex time

evolution As an example mammalian retina performs a parallel representation of the visual world embodied into layers each of which represents a particular detail of the scene These results clearly state that visual perception starts at the level of the retina and is not related uniquely to the higher brain centres Although vision remains the most useful sense guiding usual actions the other senses rest of all hearing but also touch become essential particularly in cluttered conditions where visual percepts are somehow obscured by environment conditions Efficient use of hearing can be learnt from acoustic perception in animals insects like crickets that use this ancient sense more than all the others to perform a vital function like mating
