C++ Toolkit for Engineers and Scientists James T. Smith, 2013-03-09 This book describes the design construction and use of a numerical analysis software toolkit It s written in C Version 2 0 and makes essential use of that language s Object Oriented Programming OOP features Its development environment is the Borland International Inc Borland C compiler Version 5 02 for IBM compatible personal computers However the book describes few features specific to that product The toolkit and its description and background discussions cover the most fundamental aspects of numerical analysis At the core of most scientific or engineering application programs are some of the concepts and techniques presented here The most basic include details of computation with floating point real and complex numbers mathematical functions in the C Library and a general OOP framework for vector polynomial and matrix algebra On this foundation routines are constructed for solving nonlinear equations linear and nonlinear systems of equations and eigenvalue problems The book is heavily weighted toward software development What s new here is the emphasis on software tools and on OOP techniques for

handling vectors polynomials and matrices Rather than describing programs implementing specific numerical techniques to solve specific application problems the book constructs reusable tools with which you can implement many techniques for solving broad classes of problems Examples are included to demonstrate their use The tools are organized into layers The deepest is formed by the C library functions for computing with real and complex numbers A list of errata can be found on the author's personal webpage

Software Architectures and Tools for Computer Aided Process Engineering Bertrand Braunschweig, Rafiqul Gani, 2002-10-30 The idea of editing a book on modern software architectures and tools for CAPE Computer Aided Process Engineering came about when the editors of this volume realized that existing titles relating to CAPE did not include references to the design and development of CAPE software Scientific software is needed to solve CAPE related problems by industry academia for research and development for education and training and much more There are increasing demands for CAPE software to be versatile flexible efficient and reliable This means that the role of software architecture is also gaining increasing importance Software architecture needs to reconcile the objectives of the software the framework defined by the CAPE methods the computational algorithms and the user needs and tools other software that help to develop the CAPE software The object of this book is to bring to the reader the software side of the story with respect to computer aided process engineering

PETSc for Partial Differential Equations: Numerical Solutions in C and Python Ed Bueler, 2020-10-22 The Portable Extensible Toolkit for Scientific Computation PETSc is an open source library of advanced data structures and methods for solving linear and nonlinear equations and for managing discretizations This book uses these modern numerical tools to demonstrate how to solve nonlinear partial differential equations PDEs in parallel It starts from key mathematical concepts such as Krylov space methods preconditioning multigrid and Newton's method In PETSc these components are composed at run time into fast solvers Discretizations are introduced from the beginning with an emphasis on finite difference and finite element methodologies The example C programs of the first 12 chapters listed on the inside front cover solve mostly elliptic and parabolic PDE problems Discretization leads to large sparse and generally nonlinear systems of algebraic equations For such problems mathematical solver concepts are explained and illustrated through the examples with sufficient context to speed further development PETSc for Partial Differential Equations addresses both discretizations and fast solvers for PDEs emphasizing practice more than theory Well structured examples lead to run time choices that result in high solver performance and parallel scalability The last two chapters build on the reader's understanding of fast solver concepts when applying the Firedrake Python finite element solver library This textbook the first to cover PETSc programming for nonlinear PDEs provides an on ramp for graduate students and researchers to a major area of high performance computing for science and engineering It is suitable as a supplement for courses in scientific computing or numerical methods for differential equations

Intelligent Mathematical Software Systems E.N. Houstis, R. Vichnevetsky, J.R. Rice, 1990-07-03 Most of the well known mathematical software systems are batch oriented though in the past few years there have been attempts to incorporate knowledge or expertise into these systems A number of developments have helped in making the systems more powerful and user friendly algorithm parameter selection for the solution of well defined mathematical engineering problems parallel computing computer graphics technology interface development tools and of course the years of experience with these systems and the increase in available computing power have made it practical to fulfill the potential seen in the early years of their development This book covers four main areas of the subject Application Oriented Expert Systems Advisory Systems Knowledge Manipulation Issues and User Interfaces

typical computing problems Numerically Solving Polynomial Systems with Bertini Daniel J. Bates,Jonathan D. Hauenstein,Andrew J. Sommese,Charles W. Wampler,2013-11-08 This book is a guide to concepts and practice in numerical algebraic geometry the solution of systems of polynomial equations by numerical methods Through numerous examples the authors show how to apply the well received and widely used open source Bertini software package to compute solutions including a detailed manual on syntax and usage options The authors also maintain a complementary web page where readers can find supplementary materials and Bertini input files Numerically Solving Polynomial Systems with Bertini approaches numerical algebraic geometry from a user s point of view with numerous examples of how Bertini is applicable to polynomial systems It treats the fundamental task of solving a given polynomial system and describes the latest advances in the field including algorithms for intersecting and projecting algebraic sets methods for treating singular sets the nascent field of real numerical algebraic geometry and applications to large polynomial systems arising from differential equations Those who wish to solve polynomial systems can start gently by finding isolated solutions to small systems advance rapidly to using algorithms for finding positive dimensional solution sets curves surfaces etc and learn how to use parallel computers on large problems These techniques are of interest to engineers and scientists in fields where polynomial equations arise including robotics control theory economics physics numerical PDEs and computational chemistry Orthogonal Polynomials in MATLAB Walter Gautschi,2016-05-23 Techniques for generating orthogonal polynomials numerically have appeared only recently within the last 30 or so years Orthogonal Polynomials in MATLAB Exercises and Solutions describes these techniques and related applications all supported by MATLAB programs and presents them in a unique format of exercises and solutions designed by the author to stimulate participation Important computational problems in the physical sciences are included as models for readers to solve their own problems **Automatic Differentiation in MATLAB Using ADMAT with Applications** Thomas F. Coleman,Wei Xu,2016-06-20 The calculation of partial derivatives is a fundamental need in scientific computing Automatic differentiation AD can be applied straightforwardly to obtain all necessary partial derivatives usually first and possibly second derivatives regardless of a code s complexity However the space and time efficiency of AD can be dramatically improved sometimes transforming a problem from intractable to highly feasible if inherent problem structure is used to apply AD in a judicious manner Automatic Differentiation in MATLAB using ADMAT with Applications discusses the efficient use of AD to solve real problems especially multidimensional zero finding and optimization in the MATLAB environment This book is concerned with the determination of the first and second derivatives in the context of solving scientific computing problems with an emphasis on optimization and solutions to nonlinear systems The authors focus on the application rather than the implementation of AD solve real nonlinear problems with high performance by exploiting the problem structure in the application of AD and provide many easy to understand applications examples and MATLAB templates EBOOK: Teaching Secondary Mathematics with ICT Sue Johnston-Wilder,David Pimm,2004-10-16

This is a book all mathematics teachers and teacher educators should read. It brings together a wealth of insights from a range of authors. The major issues confronting teachers of mathematics who wish to use ICT in different domains of mathematics are addressed in a clear and accessible way. Professor Celia Hoyles OBE, Dean of Research and Consultancy, Institute of Education, University of London, *Teaching Secondary Mathematics with ICT* shows the reader how to use Information and Communication Technology (ICT) effectively to enhance the teaching of mathematics in the secondary school. The book explains which forms of technology can be used to improve mathematics teaching and learning, how to get started, and where to go for further information. The first two chapters provide a useful introduction for those new to teaching mathematics with ICT. Further chapters cover topics including ICT and the curriculum, number, algebra, geometry, and statistics. Making use of interactive whiteboards in the classroom, using the internet and video conferencing to enhance teaching. The book includes practical classroom scenarios and case studies, for example the government-funded MathsAlive Initiative, as well as discussions of general issues such as the role of feedback and the use of ICT in whole class teaching. It draws on current research and is supplemented by a linked web site which provides access to demonstration copies of software and sample files. It also includes a directory of resources with lists of organisations, web sites, projects, and further reading. Key reading for Education students specialising in Mathematics and all those teaching secondary mathematics, including non-specialists and those on professional development courses.
