A Mathematical View of Interior-Point Methods in Convex Optimization James Renegar, 2001-01-01 Takes the reader who knows little of interior point methods to within sight of the research frontier *Interior Point Techniques in Optimization* B. Jansen, 2013-03-14 Operations research and mathematical programming would not be as advanced today without the many advances in interior point methods during the last decade These methods can now solve very efficiently and robustly large scale linear nonlinear and combinatorial optimization problems that arise in various practical applications The main ideas underlying interior point methods have influenced virtually all areas of mathematical programming including analyzing and solving linear and nonlinear programming problems sensitivity analysis complexity analysis the analysis of Newton's method decomposition methods polynomial approximation for combinatorial problems etc This book covers the implications of interior techniques for the entire field of mathematical programming bringing together many results in a uniform and coherent way For the topics mentioned above the book provides theoretical as well as computational results explains the intuition behind the main ideas gives examples as well as proofs and contains an extensive up to date bibliography Audience The book is intended for students researchers and practitioners with a background in operations research mathematics mathematical programming or statistics

Nonlinear Equations and Optimisation L.T. Watson, J.A. Ford, M. Bartholomew-Biggs, 2001-03-14 homepage sac cam na2000 index.html7 Volume Set now available at special set price In one of the papers in this collection the remark that nothing at all takes place in the universe in which some rule of maximum or minimum does not appear is attributed to no less an authority than Euler Simplifying the syntax a little we might paraphrase this as Everything is an optimization problem While this might be something of an overstatement the element of exaggeration is certainly reduced if we consider the extended form Everything is an optimization problem or a system of equations This observation even if only partly true stands as a fitting testimonial to the importance of the work covered by

this volume Since the 1960s much effort has gone into the development and application of numerical algorithms for solving problems in the two areas of optimization and systems of equations As a result many different ideas have been proposed for dealing efficiently with for example severe nonlinearities and or very large numbers of variables Libraries of powerful software now embody the most successful of these ideas and one objective of this volume is to assist potential users in choosing appropriate software for the problems they need to solve More generally however these collected review articles are intended to provide both researchers and practitioners with snapshots of the state of the art with regard to algorithms for particular classes of problem These snapshots are meant to have the virtues of immediacy through the inclusion of very recent ideas but they also have sufficient depth of field to show how ideas have developed and how today's research questions have grown out of previous solution attempts The most efficient methods for local optimization both unconstrained and constrained are still derived from the classical Newton approach As well as dealing in depth with the various classical or neo classical approaches the selection of papers on optimization in this volume ensures that newer ideas are also well represented Solving nonlinear algebraic systems of equations is closely related to optimization The two are not completely equivalent however and usually something is lost in the translation Algorithms for nonlinear equations can be roughly classified as locally convergent or globally convergent The characterization is not perfect Locally convergent algorithms include Newton's method modern quasi Newton variants of Newton's method and trust region methods All of these approaches are well represented in this volume

computation two new chapters discussing LU factorization were added to the second volume The most exciting improvement came from the rediscovery of the reduced simplex method In the first edition the derivation of its prototype was presented in a chapter with the same title and then converted into the so called improved version in another chapter Fortunately the author recently found a quite concise new derivation so he can now introduce the distinctive fresh simplex method in a single chapter It is exciting that the reduced simplex method can be expected to be the best LP solver ever With a focus on computation the current edition contains many novel ideas theories and methods supported by solid numerical results Being clear and succinct its content reveals in a fresh manner from simple to profound In particular a larger number of examples were worked out to demonstrate algorithms This book is a rare work in LP and an indispensable tool for undergraduate and graduate students teachers practitioners and researchers in LP and related fields
