Models Of Massive Parallelism:

Models of Massive Parallelism Max Garzon,2012-12-06 Locality is a fundamental restriction in nature On the other hand adaptive complex systems life in particular exhibit a sense of permanence and time lessness amidst relentless constant changes in surrounding environments that make the global properties of the physical world the most important problems in understanding their nature and structure Thus much of the differential and integral Calculus deals with the problem of passing from local information as expressed for example by a differential equation or the contour of a region to global features of a system s behavior an equation of growth or an area Fundamental laws in the exact sciences seek to express the observable global behavior of physical objects through equations about local interaction of their components on the assumption that the continuum is the most accurate model of physical reality Paradoxically much of modern physics calls for a fundamen tal discrete component in our understanding of the physical world Useful computational models must be eventually constructed in hardware and as such can only be based on local interaction of simple processing elements
