Nonclassical Light from Semiconductor Lasers and LEDs Jungsang

Kim, Seema Somani, Yoshihisa Yamamoto, 2012-12-06 The quantum statistical properties of light generated in a semiconductor laser and a light emitting diode LED have been a field of intense research for more than a decade This research monograph discusses recent research activities in nonclassical light generation based on semiconductor devices performed mostly at Stanford University When a semiconductor material is used as the active medium to generate photons as in semiconductor lasers and LEDs the flow of carriers electrons and holes is converted into a flow of photons Provided that the conversion is fast and efficient the statistical properties of the carriers pump noise can be transferred to the photons if pump noise can be suppressed to below the shot noise value the noise in the photon output can also be suppressed below the Poisson limit Since electrons and holes are fermions and have charges the statistical properties of these particles can be significantly different from those of photons if the structure of the light emitting device is properly designed to provide interaction between these particles There has been a discrepancy between the theoretical understanding and experimental observation of noise in a macroscopic resistor until very recently The dissipation that electrons experience in a resistor is expected to accompany the fluctuation due to partition noise leading to shot noise in the large dissipation limit as is the case with photons Experimental observation shows that thermal noise expected only in a thermal equilibrium situation zero bias condition is the only source of noise featured by a resistor dependent of the current VLSI Fabrication Principles Sorab K. Gandhi, 1994-03-31 Fully updated with the latest technologies this edition covers the fundamental principles underlying fabrication processes for semiconductor devices along with integrated circuits made from silicon and gallium arsenide Stresses fabrication criteria for such circuits as CMOS bipolar MOS FET etc These diverse technologies are introduced separately and then consolidated into complete circuits An Instructor's Manual presenting detailed solutions to all the problems in the book is available from the Wiley editorial department III-V Integrated Circuit Fabrication Technology Shibani Tikku, Dhruv Biswas, 2016-04-27 GaAs processing has reached a mature stage New semiconductor compounds are emerging that will dominate future materials and device research although the processing techniques used for GaAs will still remain relevant This book covers all aspects of the current state of the art of III V processing with emphasis on HBTs It is aimed at practicing Handbook of Concentrator Photovoltaic Technology Carlos Algorta, Ignacio Rey-Stolle, 2016-04-25 Concentrator Photovoltaics CPV is one of the most promising technologies to produce solar electricity at competitive prices High performing CPV systems with efficiencies well over 30% and multi megawatt CPV plants are now a reality As a result of these achievements the global CPV market is expected to grow dramatically over the next few years reaching cumulative installed capacity of 12.5 GW by 2020 In this context both new and consolidated players are moving fast to gain a strategic advantage in this emerging market Written with clear brief and self contained technical explanations Handbook of Concentrator Photovoltaic Technology provides a complete overview of CPV covering the fundamentals of solar radiation solar cells concentrator optics modules and trackers all aspects of characterization and reliability case studies based on the description of actual systems and plants

High Temperature Electronics F. Patrick McCluskey,Thomas Podlesak,Richard Grzybowski,2018-05-04 The development of electronics that can operate at high temperatures has been identified as a critical technology for the next century Increasingly engineers will be called upon to design avionics automotive and geophysical electronic systems requiring components and packaging reliable to 200 C and beyond Until now however they have had no single resource on high temperature electronics to assist them Such a resource is critically needed since the design and manufacture of electronic components have now made it possible to design electronic systems that will operate reliably above the traditional temperature limit of 125 C However successful system development efforts hinge on a firm understanding of the fundamentals of semiconductor physics and device processing materials selection package design and thermal management together with a knowledge of the intended application environments High Temperature Electronics brings together this essential information and presents it for the first time in a unified way Packaging and device engineers and technologists will find this book required reading for its coverage of the techniques and tradeoffs involved in materials selection design and thermal management and for its presentation of best design practices using actual fielded systems as examples In addition professors and students will find this book suitable for graduate level courses because of its detailed level of explanation and its coverage of fundamental scientific concepts Experts from the field of high temperature electronics have contributed to nine chapters covering topics ranging from semiconductor device selection to testing and final assembly
