Gordon, Shahbaz Khan, 2015-03-26 This comprehensive volume describes how ecosystem services based approaches can assist in addressing major global and regional water challenges such as climate change biodiversity loss and water security in the developing world by integrating scientific knowledge from different disciplines such as hydrological modelling environmental economics psychology and international law. Empirical assessments at the national catchment and regional levels are used to critically appraise this systemic approach and the merits and potential limitations are presented. The practicalities of this approach with regard to water resources management nature conservation and sustainable business practices are discussed and the role of society in underpinning the concept of ecosystem services is explored. **Hydrological Modelling in Arid and Semi-Arid Areas** Howard Wheater,Soroosh Sorooshian,K. D. Sharma,2007-11-22 Arid and semi arid regions are defined as areas where water is at its most scarce The hydrological regime in these areas is extreme and highly variable and they face great pressures to deliver and manage freshwater resources However there is no guidance on the decision support tools that are needed to underpin flood and water resource management in arid areas UNESCO initiated the Global network for Water and Development Information for arid lands GWADI and arranged a workshop of the world s leading experts to discuss these issues This book presents chapters from contributors to the workshop and includes case studies from the world s major arid regions to demonstrate model applications and web links to tutorials and state of the art modelling software This volume is a valuable reference for researchers and engineers working on the water resources of arid and semi arid regions

Boojh, 2014-01-01 The book Climate Change and Himalaya Natural hazards and mountain resources presents the resources of Himalaya along with the potential natural hazards It consists twenty two chapters from researchers working in different institutions with multi disciplinary approach More than seven hundred glaciers were monitored and discussed in one of the chapter of this book This book will be highly useful to researchers policy makers students and is an essential document to libraries of universities colleges research institutions and personnel collections

The Foreseeable Future for Water Planning Andrew James Segrave, 2014-09-14 People and societies conceptualise and experience time in fundamentally different ways This basic aspect of perception significantly influences the way we frame problems and conceive solutions This book shows how time perspectives differ across national cultures and across professional roles It shows how these differences generate ambiguity when it comes to defining problems and devising solutions in the water sector This is especially important when dealing with problems such as Sustainable Water Resources Management and Climate Change that involve culturally and professionally diverse stakeholders Response strategies to such problems inherently require concerted action because of the large spatial and temporal scale on which they take place and to minimise the occurrence of conflicting interventions This disparity between diverse problem perceptions and the need for collective understanding and united action is increasingly recognised as an important concern in the field of water resource

management The conclusions are important because the time horizons considered in planning and setting research agendas influence what problems are perceived what questions are asked and what solutions are sought In general more time needs to be invested in framing problems This is particularly important for participatory planning and transdisciplinary research where the diversity in Motivational Space is greatest It is recommended that Motivational Space be collectively and explicitly framed from the outset of all planning projects especially in terms of Temporal Extent When it comes to setting research agendas it is important to match the Motivational Space of those who prioritize the questions with the goal of the research programme Author Andrew James Segrave KWR Watercycle Research Institute Utrecht The Netherlands

*Groundwater Modelling in Arid and Semi-Arid Areas* Howard S. Wheeler, Simon A. Mathias, Xin Li, 2010-09-09 Arid and semi arid regions face major challenges in the management of scarce freshwater resources under pressures of population economic development climate change pollution and over abstraction Groundwater is commonly the most important water resource in these areas Groundwater models are widely used globally to understand groundwater systems and to guide decisions on management However the hydrology of arid and semi arid areas is very different from that of humid regions and there is little guidance on the special challenges of groundwater modelling for these areas This book brings together the experience of internationally leading experts to fill a gap in the scientific and technical literature It introduces state of the art methods for modelling groundwater resources illustrated with a wide ranging set of illustrative examples from around the world The book is valuable for researchers practitioners in developed and developing countries and graduate students in hydrology hydrogeology water resources management environmental engineering and geography
