

am, carbon, and oxygen. Dolomite is only a little in use. Its streak is like that of gypsum and calcite. Some varieties of granite the dark are hornblende instead of black. Hornblende is the commonest of silicates in the mineral family called silicates.

Fairly large crystals of quartz are often found. This mineral is dark green or black. The name comes from a Greek word "decur." Hornblende is the mineral galena, a variety of lead. Hornblende is lead.

The other two amphiboles made of thin fibers are used as asbestos. Amphibole is a form of asbestos.

Micas and feldspar contain silicon and oxygen. The other pyroxenes.

Some pyroxene, often found as

word for "luster." Amphibole is always dark, often black. So is pyroxene. Diopside, on the other hand, is sometimes white. Varieties of another pyroxene, spodumene, are beautiful gemstones. Some jade is jadeite, still another prized pyroxene.

The story of minerals containing silicon continues with the zeolites. None of the zeolites is itself very important, and nowhere are there great amounts of them. But the 50 or so minerals in the big family are scattered far and wide. Zeolite minerals are usually found as crystals. Those shown are all pearly white, but stilbite crystals are often a salmon color or red, and chabazite is sometimes pink or yellow. Natrolite is often called needle zeolite because of its slender crystals spread out like a fan.

When a zeolite is heated, water bubbles up from it. "Zeolite" comes from Greek words that mean "boiling stone."

Five of the other six minerals pictured here tell more of the silicon story. The only one that is not partly silicon is lithium. It is a soft, silvery metal.

pages in another way, too. It is the only one that leaves a colored streak. The streak is the same color as the mineral—yellowish brown. Limonite gets its color from the iron in it. Much soil gets its color from limonite.

Olivine, as you could guess, gets its name from its color. It usually is olive green. Clear varieties of this hard mineral (6½-7) are used as gems.

Chlorite, too, was named for its color. The name chlorite means "green." Many greenish rocks owe their color to chlorite, which is soft enough to be scratched with a fingernail. Like mica, chlorite crystals can be split into thin sheets.

The tourmaline pictured looks a little like hornblende. But not all tourmaline is dark. Some is white, some green, some pink, and some red. A single crystal of watermelon tourmaline may have a red core surrounded by a white zone, which in turn is surrounded by green. As you would expect, tourmaline crystals are often cut as gems.

Kaolin is a name for a small group of minerals impossible to tell apart in an ordinary way. All contain silicon, oxygen, and aluminum, and all are white when pure. Impure kaolin is common around the world. Most people know it as clay. The mineral makes up a greater part of soil. It is not so soft that it has an earthy smell.

Serpentine is a very common mineral with a greasy feel. Some varieties carved and polished easily. Foliated serpentine looks much like polished soapstone. But not all serpentine can be polished. A variety called chrysotile

Rock Geochemistry in Mineral Exploration G.J.S. Govett, 2013-10-22 Handbook of Exploration Geochemistry Volume 3  
Rock Geochemistry in Mineral Exploration focuses on the application of rock geochemistry in mineral exploration including deposits of plutonic association volcanic and sedimentary association and sequence of geochemical exploration The publication first elaborates on geochemistry in the exploration sequence crustal abundance geochemical behavior of elements and problems of sampling and recognition of geochemical anomalies Discussions focus on population partition spatial distribution of data abundance of elements classification and geochemical behavior of elements principles underlying geochemical exploration sequence of geochemical exploration and main types of geochemical surveys The text then takes a look at regional scale exploration for deposits of plutonic association regional scale exploration for vein and replacement deposits and regional scale exploration for stratiform deposits of volcanic and sedimentary association The book ponders on the synthesis of geochemical responses and operational conclusions local and mine scale exploration for stratiform deposits of volcanic and sedimentary association in Cyprus Turkey and Oceania New Brunswick deposits and Precambrian Proterozoic and Kuroko deposits The text is a valuable reference for researchers interested in the application of rock geochemistry in mineral exploration

*Rare Earth Elements in Ultramafic and Mafic Rocks and their Minerals* Felix P. Lesnov, 2012-03-22  
This book presents an extensive overview of literature published globally in the last decades on REE distribution in minor and accessory minerals from various types of ultramafic mafic and other plutonic rocks It is a continuation of the author's work published in 2010 *Rare Earth Elements in Ultramafic and Mafic Rocks and their Minerals* Main Types of Rocks Rock Forming Minerals The analytical database created includes over 900 analyses of minerals including garnets 341 chrome spinels 38 ilmenites 160 zircons 210 apatites 62 titanites 51 perovskites 46 and micas 35 The book offers a brief historical background on REE distribution for each of the minerals and analytical methods for their determination further the main features of concentration of these impurities in the samples of different rocks and their manifestations are described and the regularities of REE distribution between coexisting phases including parent melts systematized available estimates of distribution coefficients are considered REE isomorphism in these minerals is discussed as well as the possibilities of using data on REE distribution as typomorphic signs of determining the crystallization conditions of minerals The numerous analyses of REE presented in this book can be used as reference data Finally there is an additional chapter on a new problem the study of geochemical relations between REE and platinum group elements As an overview of modern data on the geochemistry of REE in minor and accessory minerals from rocks of mafic ultramafic complexes and as a reference book this work will be of interest to a wide range of specialists studying petrology and geochemistry of products of ultramafic and mafic magmatism including ore mineralization as well as for graduate and undergraduate university students in geology departments

**Lamprophyres** N. M. S. Rock,2013-11-11 Following their recognition by GÜbel 1874 lamprophyres were treated for an entire century as little more than obscure curiosities Although this situation has changed recently with a flowering of publications and active workers lamprophyres remain almost the only group of igneous rocks which have not yet received attention in a dedicated monograph In five exploratory reviews 1977 1987 the writer aimed to set out what was known about these rocks The IUGS Subcommittee on igneous rock systematics had meanwhile presented its nomenclatural framework Streckeisen 1979 All this has now been overtaken by a recent explosion of interest epitomized not least by lamprophyres greater prominence in the 4th International Kimberlite Conference Proceedings More data have become available since 1985 than over the entire previous century and it is obviously impossible for such an extraordinary outpouring to be fully reviewed in this first preliminary book At the risk of dissatisfying some readers therefore this book concentrates on factual matters and on a broad overview rather than minutiae Because not even a world map of known lamprophyres was previously available almost half the book is deliberately taken up by the first global lamprophyre compilation and its commensurately extensive Bibliography Such a compendium of largely objective information is believed to be of more immediate interest and lasting value than a premature pottage of petrogenetic polemic Chapters 1 7 bring previous studies up to date and concentrate on factual information

**Hydrothermal Mineral Deposits** Franco Pirajno,2012-12-06 This book is intended primarily for exploration geologists and post graduate students attending specialist courses in mineral exploration Exploration geologists are engaged not only in the search for new mineral deposits but also in the extension and re assessment of existing ones To succeed in these tasks the exploration geologist is required to be a generalist of the Earth sciences rather than a specialist The exploration geologist needs to be familiar with most aspects of the geology of ore deposits and detailed knowledge as well as experience play an all important role in the successful exploration for mineral commodities In order to

achieve this it is essential that the exploration geologist be up to date with the latest developments in the evolution of concepts and ideas in the Earth sciences This is no easy task as thousands of publications appear every year in an ever increasing number of journals periodicals and books For this reason it is also difficult at times to locate appropriate references on a particular mineral deposit type although this problem is alleviated by the existence of large bibliographic data bases of geological records abstracts and papers on computers During my teaching to explorationists and indeed during my years of work as an explorationist the necessity of having a text dealing with the fundamental aspects of hydrothermal mineral deposits has always been compelling Metallic mineral deposits can be categorised into three great families namely I magmatic 2 sedimentary and residual 3 hydrothermal
