Eigenvalue Problems in Power Systems Federico Milano, Ioannis Dassios, Muyang Liu, Georgios Tzounas, 2020-12-22
The book provides a comprehensive taxonomy of non symmetrical eigenvalues problems as applied to power systems The book bases all formulations on mathematical concept of matrix pencils MPs and considers both regular and singular MPs for the eigenvalue problems Each eigenvalue problem is illustrated with a variety of examples based on electrical circuits and or power system models and controllers and related data are provided in the appendices of the book Numerical methods for the solution of all considered eigenvalue problems are discussed The focus is on large scale problems and hence attention is dedicated to the performance and scalability of the methods The target of the book are researchers and graduated students in Electrical Computer Science Engineering both taught and research Master programmes as well as PhD programmes and it explains eigenvalue problems applied into electrical power systems explains numerical examples on applying the mathematical methods into studying small signal stability problems of realistic and large electrical power systems includes detailed and in depth analysis including non linear and other advanced aspects provides theoretical understanding and advanced numerical techniques essential for secure operation of power systems provides a comprehensive set of illustrative examples that support theoretical discussions

Numerical Simulation Algorithm of Electromagnetic Field for Grounding Problems in Power System Substation Grounding Grids Zhong-Xin Li, 2025-04-01 This book focuses on numerical methods for grounding problems in substation grounding systems which are rooted in horizontal multilayered earth models The book discusses both theories and engineering applications and provides case studies to verify the accuracy of the methods introduced Up to ten horizontal multilayered soil models were considered This book employs numerical algorithms for Galerkin s method including Galerkin s method of moments Galerkin s boundary element method and hybrid algorithms based on a variety of basis functions that have emerged as a result of simplifying Galerkin s method of moments These numerical methods include both frequency and time domain algorithms that can be used to numerically simulate transient and steady state grounding problems in substation grounding grids The most outstanding feature of this book is the incorporation of the frequency and time domain quasi static complex imaging method QSCIM for point current sources in layered conducting media and its closed form Green s function as well as analytical algorithms for calculating the spatial two dimensional line integrals of mutual impedances and inductances into numerical algorithmic modeling of electromagnetic fields which greatly improves computational speed and accuracy

Power Line Interference; Problems and Solutions Russ Gundrum, 1982 In less than 100 years the power and telecommunications industries have become highly technological and competent in servicing the growing electrical power and communication needs of a complex modern society This tremendous advancement has not been without problems of mutual compatibility however In the early days of power and telecommunication transmission fundamental incompatibilities existed between the two systems since both used the earth as

a ground return conductor As the length of both systems lines grew and the number of subscribers increased the inductive interference problems became more severe Further expansion of both industries was seriously threatened when it became necessary to refer these problems to the courts and commissions for resolution such as California's General Order 52 issued in 1912 As a consequence representatives from both industries joined in cooperative efforts to study and resolve the main causes of incompatibility This joint effort primarily between the Edison Electric Institute and the Bell System resulted in over fifty engineering reports during the 1920 s and 30 s This cooperation resulted in numerous advances and innovations with the primary development being paired conductors enclosed in metallic shielded cables for telecommunications transmission Developments such as drainage reactors longitudinal chokes neutralizing transformers and isolation transformers also occurred and were applied to open wire lines to suppress power line interference The above practices and procedures were usually adequate in solving most electromagnetic and electrostatic induced voltage and current problems However in the 1960 s and 70 s certain design features and trends in the environment occurred that presented new and challenging problems in the area of incompatibility As a result the Institute of Electrical and Electronic Engineers IEEE formed the Inductive Coordination and Electrical Protection ICEP Committee to provide effective execution of the following considerations 1 Design of systems to minimize inductive interference and susceptibility 2 Adopt standards and guidelines relating to interference 3 Establish a continuing dialog between interested parties to provide a medium for exchanging information in the advanced planning stages of new facilities In the meantime some manufacturers have responded to the industry's need for equipment similar to that used in the open wire days but better designed and more economical for cable applications Information on these devices is provided in the later chapters of this manual
