Nonlinearities and Synchronization in Musical Acoustics and Music Psychology Rolf Bader, 2013-02-01 Nonlinearities are a crucial and founding principle in nearly all musical systems may they be musical instruments timbre or rhythm perception and production or neural networks of music perception This volume gives an overview about present and past research in these fields In Musical Acoustics on the one hand the nonlinearities in musical instruments often produce the musically interesting features On the other musical instruments are nonlinear by nature and tone production is the result of synchronization and self organization within the instruments Furthermore as nearly all musical instruments are driven by impulses an Impulse Pattern Formulation IPF is suggested an iterative framework holding for all musical instruments It appears that this framework is able to reproduce the complex and perceptually most salient initial transients of musical instruments In Music Psychology nonlinearities are present in all areas of musical features like pitch timbre or rhythm perception In terms of rhythm production and motion self organizing models are the only ones able to explain sudden phase transitions while tapping Self organizing neural nets both of the Kohonen and the connectionist types are able to reproduce tonality timbre similarities or phrases The volume also gives an overview about the signal processing tools suitable to analyze sounds in a nonlinear way both in the Fourier domain like Wavelets or correlograms and in the phase space domain like fractal dimensions or information structures Furthermore it gives an introduction to Physical Modeling of musical instruments using Finite Element and Finite Difference methods to cope with the high complexity of instrument bodies and wave couplings It appears that most musical systems are self organized ones and only therefore able to produce all unexpected and interesting features of music both in production and perception
