Problems In Palaeoclimatology:

Problems in Palaeoclimatology A. E. M. Nairn, 1965 Paleoclimatology Colin P. Summerhayes, 2020-06-10 Life on our planet depends upon having a climate that changes within narrow limits not too hot for the oceans to boil away nor too cold for the planet to freeze over Over the past billion years Earth's average temperature has stayed close to 14-15°C oscillating between warm greenhouse states and cold icehouse states We live with variation but a variation with limits Paleoclimatology is the science of understanding and explaining those variations those limits and the forces that control them Without that understanding we will not be able to foresee future change accurately as our population grows Our impact on the planet is now equal to a geological force such that many geologists now see us as living in a new geological era the Anthropocene Paleoclimatology describes Earth's passage through the greenhouse and icehouse worlds of the past 800 million years including the glaciations of Snowball Earth in a world that was then free of land plants It describes the operation of the Earth's thermostat which keeps the planet fit for life and its control by interactions between greenhouse gases land plants chemical weathering continental motions volcanic activity orbital change and solar variability It explains how we arrived at our current understanding of the climate system by reviewing the contributions of scientists since the mid 1700s showing how their ideas were modified as science progressed And it includes reflections based on the author's involvement in palaeoclimatic research The book will transform debate and set the agenda for the next generation of thought about future climate change It will be an invaluable course reference for undergraduate and postgraduate students in geology climatology oceanography and the history of science A real tour de force An outstanding summary not only of the science and what needs to be done but also the challenges that are a consequence of psychological and cultural baggage that threatens not only the survival of our own species but the many others we are eliminating as well Peter Barrett Emeritus Professor of Geology Antarctic Research Centre Victoria University of Wellington New Zealand What a remarkable and wonderful synthesis it will be a wonderful source of paleoclimate information and insights Christopher R Scotese Professor Department of Earth and Planetary Sciences Northwestern University Evanston IL USA **Encyclopedia of**

Paleoclimatology and Ancient Environments Vivien Gornitz, 2008-10-31 One of Springer's Major Reference Works this book gives the reader a truly global perspective It is the first major reference work in its field Paleoclimate topics covered in the encyclopedia give the reader the capability to place the observations of recent global warming in the context of longer term natural climate fluctuations Significant elements of the encyclopedia include recent developments in paleoclimate modeling paleo ocean circulation as well as the influence of geological processes and biological feedbacks on global climate change The encyclopedia gives the reader an entry point into the literature on these and many other groundbreaking topics

science This four volume treatise on the continental drift controversy is the first complete history of the origin debate and gradual acceptance of this revolutionary theory Based on extensive interviews archival papers and original works Frankel weaves together the lives and work of the scientists involved producing an accessible narrative for scientists and non scientists alike This third volume describes the expansion of the land based paleomagnetic case for drifting continents and recounts the golden age of marine geology and geophysics Fuelled by the Cold War US and British workers led the way in making discoveries and forming new hypotheses especially about the origin of oceanic ridges When first proposed seafloor spreading was just one of several competing hypotheses about the evolution of ocean basins

Paleontology and Geology of Laetoli: Human Evolution in Context Terry Harrison,2011-01-19 This volume 1 and its companion volume 2 present the results of new investigations into the geology paleontology and paleoecology of the early hominin site of Laetoli in northern Tanzania The site is one of the most important paleontological and paleoanthropological sites in Africa worldrenowned for the discovery of fossils of the early hominin Australopithecus afarensis as well as remarkable trails of its footprints The first volume provides new evidence on the geology geochronology ecology ecomorphology and taphonomy of the site The second volume describes newly discovered fossil hominins from Laetoli belonging to Australopithecus afarensis and Paranthropus aethiopicus and presents detailed information on the systematics and paleobiology of the diverse associated fauna Together these contributions provide one of the most comprehensive accounts of a fossil hominin site and they offer important new insights into the early stages of human evolution and its context

Physical and Information Models in Geography (Routledge Revivals) Richard Chorley,Peter Haggett,2013-10-14 First published in 1967 this book explores the theme of geographical generalization or model building It is composed of eight of the chapters from the original Models in Geography published in 1967 The first chapter broadly outlines geographical generalization and examines the nature and function of generalized statements ranging from conceptual models to scale models in a geographical context The following chapter deals with model theory in a wider scientific framework and the rest of the book discusses models of physical systems and information models The book considers model type generalizations that are applied in the three fields of geomorphology meteorology and climatology and hydrology before focusing on the transference of information and ideas in geography This text represents a robustly anti idiographic statement of modern work in one of the major branches of geography

The Sun-Climate Connection Over the Last Millennium Facts and Questions Maxim Ogurtsov,Risto Jalkanen,Markus Lindholm,Svetlana Veretenenko,2015-01-02 The search for a cause of the global warming phenomenon on our planet has sparked some interest in the scientific community The connection between changes occurring in the sun and global warming presents one fundamental perspective which has been investigated by a number of scientific research groups In recent times there have been some promising results that might help us uncover the clues about such a link The Sun Climate Connection over the Last Millennium facts and questions presents fundamental information about the solar activity space weather

terrestrial climates and their variations over an extended period of time The information presented is a set of analyses based on modern methods of statistical analysis of non stationary time series including Fourier wavelet and singular spectral analysis while considering space weather phenomena solar winds solar flares aurora borealis etc and other terrestrial manifestations of solar activity The physical mechanisms potentially linking solar activity and space weather to climate are discussed based on these analyses The eBook also provides some context of modern millennial temperature reconstructions for explaining global warming in the 20th century Scenarios of the solar activity and climate evolution throughout the 21st century are considered on the basis of the updated data The eBook provides useful facts for researchers seeking information on climate and space research with respect to solar phenomena

Earth's Glacial Record M. Deynoux, J. M. G. Miller, E.

W. Domack, 1994 This book discusses glacial or glacially controlled sequences as markers of the Earth's geodynamic and climatic history

Earth's Climate Evolution C. P. Summerhayes, 2015-07-13 To understand climate change today we first need to know how Earth's climate changed over the past 450 million years Finding answers depends upon contributions from a wide range of sciences not just the rock record uncovered by geologists In Earth's Climate Evolution Colin Summerhayes analyzes reports and records of past climate change dating back to the late 18th century to uncover key patterns in the climate system The book will transform debate and set the agenda for the next generation of thought about future climate change The book takes a unique approach to the subject providing a description of the greenhouse and icehouse worlds of the past 450 million years since land plants emerged ignoring major earlier glaciations like that of Snowball Earth which occurred around 600 million years ago in a world free of land plants It describes the evolution of thinking in palaeoclimatology and introduces the main players in the field and how their ideas were received and in many cases subsequently modified It records the arguments and discussions about the merits of different ideas along the way It also includes several notes made from the author's own personal involvement in palaeoclimatological and palaeoceanographic studies and from his experience of working alongside several of the major players in these fields in recent years This book will be an invaluable reference for both undergraduate and postgraduate students taking courses in related fields and will also be of interest to historians of science and or geology climatology and oceanography It should also be of interest to the wider scientific and engineering community high school science students policy makers and environmental NGOs Reviews Outstanding in its presentation of the facts and a good read in the way that it intersperses the climate story with the author's own experiences This book puts the climate story into a compelling geological history Dr James Baker The book is written in very clear and concise prose and takes original enlightening and engaging approach to talking about ideas from the perspective of the scientists who promoted them Professor Christopher R Scotese A thrilling ride through continental drift and its consequences Professor Gerald R North Written in a style and language which can be easily understood by laymen as well as scientists Professor Dr Jörn Thiede What makes this book particularly distinctive is how well it builds in the narrative

Palaeoclimates and their Modelling J.R.L. Allen, B.J. Hoskins, P.J. Valdes, B.W. Sellwood, R. Spicer, 2012-12-06 The climate of the Earth has undergone many changes and for those times when geologic data are widespread and abundant the Mesozoic appears to have been one of the warmest intervals This was a time during which the single continent Pangea disintegrated into continental units similar to those of today a time when there were no significant polar ice caps and sea level was generally much higher than at the present time and a time when dinosaurs apparently dominated terrestrial faunas and the flowering plants evolved Understanding this alien world ancestral to ours is intrinsically interesting intellectually

challenging and offers opportunities for more effective targeting of sites where commercially important geological resources may be found It also provides critical insights into the operation of coupled Earth systems biospheric atmospheric hydrospheric and geospheric under extreme greenhouse conditions and therefore may have relevance to possible future global change Our intention in organizing this Discussion Meeting was to bring together those who gather and interpret geologic data with those who model global climates from first principles The community of workers who study the Quaternary have made significant advances by integrating and comparing palaeodata and climate model experiments Although we have focused not on the Quaternary icehouse but on the Mesozoic hothouse climate we are well aware that approaches used in the study of the Quaternary may have relevance to earlier times

Global Palaeoclimate of the Late Cenozoic V.A. Zubakov,I.I. Borzenkova,1990-03-20 This is a detailed description of the history and chronology of global climate based on event signal stratigraphy The history of global climate is described for the last fifty million years with the description for the last one million years in detail Climastratigraphic sequences of twelve key regions are taken as a basis eight of them situated in the USSR territories Chronology of climatic events of the Pleistocene Pliocene and Miocene is developed based on palaeomagnetic and radiometric data The authors version of its correlation with oxygen isotope scales of deep sea sediments is given Theoretical problems of climatic stratigraphy and palaeoclimatology are discussed in particular the causes of climatic change The Northern Hemisphere palaeoclimatic reconstructions are made for the Holocene Eemian and Pliocene temperature optima considered as possible palaeoanalogues of climate of the 21st Century The book is intended primarily for a wide circle of scientific workers palaeoclimatologists and palaeogeographers but will also interest geologists biologists palaeomagnetologists and archaeologists

Evolution of the Cretaceous Ocean-climate System Enriqueta Barrera,Claudia C. Johnson,1999-01-01 Resolving the Late Paleozoic Ice Age in Time and Space Christopher R. Fielding,Tracy D. Frank,John L. Isbell,2008-01-01 This volume summarizes new developments in understanding the longest lived icehouse period in Phanerozoic Earth history the late Paleozoic ice age Resolving the Late Paleozoic Ice Age in Time and Space provides summaries of existing and new data from the various Gondwanan continental relics and also reviews stratigraphic successions from the paleotropical and temperate regions of Laurussia that preserve an indirect record of glaciation It addresses the extent to which records of glaciation indicate protracted long term climatic austerity as opposed to fluctuating more dynamic climate and provides new constraints on the timing of glaciation Additionally it tackles questions of synchronicity of glaciation across the various Gondwanan continental relics and timing relationships between near field and far field records at greater levels of resolution than has been possible previously Results point toward a dynamic icehouse regime that is comparable to the Cenozoic icehouse and away from traditional interpretations of the late Paleozoic ice age as a single protracted event that involved stable long lived ice centers Publisher s website Mesozoic Mammals

Woo-Seok,Paul Watts,2012-12-06 This is the first detailed analysis of the complex and rich vegetation of the mountainous Korean peninsula which ranges from arctic alpine to subtropical in character and in which more than 4500 vascular plant species have been recorded including many endemics It covers both the north and south of the peninsula and using both past and present records identifies eight major biogeographic regions It pays due attention to vegetation history tracing this back to Miocene times and noting the effects of Pleistocene climatic fluctuations More recently detailed climatic variations from 50 B C are recorded along with man s influence on vegetation patterns Special mention is made of the present arctic alpine communities their structural and floristic characteristics their origins and their vulnerability to current global warming Throughout the relationships between Korean vegetation communities and those present in adjacent East Asia are emphasized along with those key features which make Korean communities distinctly unique
