*In its essence, the materials selection process, which is a critical task in modern engineering design and manufacturing, is regarded to be an information processing routine. The engineering design process, including the selection of materials in design, is regarded to be a decision making process in which choices are made from among the available alternatives. Development and use of a materials selection process, or materials selection processes, based on the principles of decision theory and information processing is called for. The process or processes so developed should be implemented on digital computer to take advantage of the computer's immense capacity for information processing. This would comprise an important component of computer-aided engineering.*

## 1. Introduction

All manufactured products, constructed structures, and infrastructure, everything from toys, domestic utensils, and furniture, to agricultural, commercial, and industrial machines, to roads, bridges, and dams, is made of material. Therefore, at some point in the process of engineering design, decisions have to be made as to which materials and what processes will be used in order to realize the product. The importance of materials to mankind is perhaps best underscored by the fact that epochal eras in civilization have been identified by the materials that were then in prevalent use. The bronze age, the iron age, and the stone age are examples of this practice.

The engineering profession may be defined as “the art and science of harnessing the **information, materials and energy** resources that occur in nature, for the benefit of mankind.” Moreover, on a little reflection, it should be evident that the basic ingredients of any technology are energy, information, and materials. Materials, therefore, must be of great interest to the engineer. The engineers’ interest in materials may be drawn to diverse aspects such as *The Materials Science Aspect*, and *The Materials Management Aspect*. However, to design and manufacturing engineers, it is *The Materials Selection Aspect* that should be of most interest. Until recently, this particular aspect has often not been adequately addressed in the common literature on engineering design and manufacturing.

Magrab, 1997-07-23 The Integrated Product and Process Design and Development IP2D2 method is quickly becoming the new standard for the rapid creation of competitively priced high quality products IP2D2 indicates in the broadest sense the overlapping interacting and

iterative nature of all of the aspects of the product realization process The method is a continuous process whereby a product's cost performance and features value and time to market lead to a company's increased profitability and market share This new text reference reflects the sweeping changes this approach has brought to traditional engineering design courses and to industry Carefully organized with sections on each major stage of the approach Integrated Product and Process Design and Development The Product Realization Process is the first complete treatment of this new direction in engineering The book is designed to help you cultivate an attitude toward design that encourages creativity and innovation while considering the equally important considerations of customer requirements and satisfaction quality reliability manufacturing methods and material selection assembly cost the environment and scheduling Extensively class tested in senior and graduate level engineering design courses at the University of Maryland the book gives equal time to conceptual and practical aspects As each concept is introduced and explained two book long examples provide you with a realistic sense of how a product's creation progresses through its various stages Numerous checklists and other practical guidelines help you learn to apply the IP2D2 method to your own work Students and newly graduated engineers will appreciate the modern perspective that more nearly reflects what they will encounter in practice than what is obtainable in traditional texts For more experienced practicing engineers this is the new information they need to keep up with recent rapid changes and stay marketable today and in the future
