Model Selection and Inference Kenneth P. Burnham, David R. Anderson, 2013-11-11 We wrote this book to introduce graduate students and research workers in various scientific disciplines to the use of information theoretic approaches in the analysis of empirical data In its fully developed form the information theoretic approach allows inference based on more than one model including estimates of unconditional precision in its initial form it is useful in selecting a best model and ranking the remaining models We believe that often the critical issue in data analysis is the selection of a good approximating model that best represents the inference supported by the data an estimated best approximating model Information theory includes the well known Kullback Leibler distance between two models actually probability distributions and this represents a fundamental quantity in science In 1973 Hirotugu Akaike derived an estimator of the relative Kullback Leibler distance based on Fisher's maximized log likelihood His measure now called Akaike's information criterion AIC provided a new paradigm for model selection in the analysis of empirical data His approach with a fundamental link to information theory is relatively simple and easy to use in practice but little taught in statistics classes and far less understood in the applied sciences than should be the case We do not accept the notion that there is a simple true model in the biological sciences

Model Selection and Multimodel Inference Kenneth P. Burnham, David R. Anderson, 2003-12-04 A unique and comprehensive text on the philosophy of model based data analysis and strategy for the analysis of empirical data The book introduces information theoretic approaches and focuses critical attention on a priori modeling and the selection of a good approximating model that best represents the inference supported by the data It contains several new approaches to estimating model selection uncertainty and incorporating selection uncertainty into estimates of precision An array of examples is given to illustrate various technical issues The text has been written for biologists and statisticians using models for making inferences from empirical data

Understanding Human Development Ursula M. Staudinger, Ulman E.R. Lindenberger, 2012-12-06 K Warner Schaie I am pleased to write a foreword for this interesting volume particularly as over many years I have had the privilege of interacting with the editors and a majority of the contributors in various professional

roles as a colleague mentor or research collaborator The editors begin their introduction by asking why one would want to read yet another book on human development They immediately answer their question by pointing out that many developmentally oriented texts and other treatises neglect the theoretical foundations of human development and fail to embed psychological constructs within the multidisciplinary context so essential to understanding development This volume provides a positive remedy to past deficiencies in volumes on human development with a well organized structure that leads the reader from a general introduction through the basic processes to methodological issues and the relation of developmental constructs to social context and biological infrastructure This approach does not surprise After all the editors and most of the contributors at one time or another had a connection to the Max Planck Institute of Human Development in Berlin whether as students junior scientists or senior visitors That institute under the leadership of Paul Baltes has been instrumental in pursuing a systematic lifespan approach to the study of cognition and personality Over the past two decades it has influenced the careers of a generation of scientists who have advocated long term studies of human development in an interdisciplinary context
