Subduction Zones ,1993 Subduction Zones Part II Larry J. Ruff,H. Kanamori,2012-12-06 Subduction zones consume oceanic lithosphere and are an indispensable part of plate tectonics Unlike the oceanic lithosphere production system which can be linked as a nearly continuous albeit sinuous strand around the earth subduction zones are a rather dissociated group and are found in several isolated corners of the world While plate tectonics can predict that subduction zones are required along certain plate boundaries it does not stipulate how subduction zones initiate and develop The preservation of newly created oceanic lithosphere and the propensity for spreading centers to fragment continents leaves a wealth of geological information on the initiation and evolution of spreading On the other hand the subject of subduction initiation has little observational basis To find such observations we need to look at some muddled tectonic regimes The Macquarie Ridge complex presents a natural laboratory for studies of subduction initiation 2 Tectonics of the Macquarie Ridge Complex The Macquarie Ridge complex is a complicated physiographic feature that trends approximately north south between South Island New Zealand and the Pacific Antarctica spreading center This feature consists of a sequence of troughs and ridges with Macquarie Island as the only exposed expression The seismically active Macquarie Ridge complex hereafter MRC is crudely continuous with the Tonga Kermadec New Zealand seismic activity The basic physiographic features and seismicity of the MRC are shown in Figure I The earthquake epicenters generally cluster about the bathymetric expression of the MRC
