Multi-Hierarchical Representation of Large-Scale Space Juan A. Fernández, Javier González, 2013-03-09 It has been stated in psychology that human brain arranges information in a way that improves efficiency in performing common tasks for example information about our spatial environment is conveniently structured for efficient route finding On the other hand in computational sciences the use of hierarchical information is well known for reducing the complexity of solving problems This book studies hierarchical representations of large scale space and presents a new model called Multi AH graph that uses multiple hierarchies of abstraction It allows an agent to represent structural information acquired from the environment elements such as objects free space etc relations existing between them such as proximity similarity etc and other types of information such as colors shapes etc The Multi AH graph model extends a single hierarchy representation to a multiple hierarchy arrangement which adapts better to a wider range of tasks agents and environments We also present a system

called CLAUDIA which is an implementation of the task driven paradigm for automatic construction of multiple abstractions a set of hierarchies of abstraction will be good for an agent if it can reduce the cost of planning and performing certain tasks of the agent in the agent's world CLAUDIA constructs multiple hierarchies Multi AH graphs for a given triple trying to optimize their goodness

Genetic Systems Programming Ajith Abraham, 2008-07-21 Designing complex programs such as operating systems compilers filing systems data base systems etc is an old ever lasting research area Genetic programming is a relatively new promising and growing research area Among other uses it provides efficient tools to deal with hard problems by evolving creative and competitive solutions Systems Programming is generally strewn with such hard problems This book is devoted to reporting innovative and significant progress about the contribution of genetic programming in systems programming The contributions of this book clearly demonstrate that genetic programming is very effective in solving hard and yet open problems in systems programming Followed by an introductory chapter in the remaining contributed chapters the reader can easily learn about systems where genetic programming can be applied successfully These include but are not limited to information security systems compilers data mining systems stock market prediction systems robots and automatic programming

Trackability and Tracking of General Linear Systems Lyubomir T. Gruyitch, 2018-10-31 Trackability and Tracking of General Linear Systems deals with five classes of the systems three of which are new begins with the definition of time together with a brief description of its crucial properties and with the principles of the physical uniqueness and continuity of physical variables They are essential for the natural tracking control synthesis The book presents further new results on the new compact simple and elegant calculus that enabled the generalization of the transfer function matrix concept and of the state concept the completion of the trackability and tracking concepts together with the proofs of the trackability and tracking criteria as well as the natural tracking control synthesis for all five classes of the systems Features Crucially broadens the state space concept and the complex domain fundamentals of the dynamical systems to the control systems Addresses the knowledge and ability necessary to study and design control systems that will satisfy the fundamental control goal Outlines new effective mathematical means for effective complete analysis and synthesis of the control systems Upgrades completes and essentially generalizes the control theory beyond the existing boundaries Provides information necessary to create and teach advanced inherently upgraded control courses

Congress on Evolutionary Computation**, 1999 Linear Discrete-Time Systems Zoran M. Buchevats, Lyubomir T. Gruyitch, 2017-11-22 This book covers crucial lacunae of the linear discrete time time invariant dynamical systems and introduces the reader to their treatment while functioning under real natural conditions in forced regimes with arbitrary initial conditions It provides novel theoretical tools necessary for the analysis and design of the systems operating in stated conditions The text completely covers two well known systems IO and ISO along with a new system IIO It discovers the concept of the full transfer function matrix $F(z)$ in the z complex domain which incorporates the Z transform of the system input and another variable vectors all with arbitrary initial conditions Consequently it addresses the full system matrix $P(z)$ and the full block diagram technique based on the use of $F(z)$ which incorporates the Z transform of the system input and another variable vectors all with arbitrary initial conditions The book explores the direct relationship between the system full transfer function matrix $F(z)$ and the Lyapunov stability concept definitions and conditions as well as with the BI stability concept definitions and conditions The goal of the book is to unify the study and applications of all three classes of the linear discrete time time invariant system for short systems
