Selected Writings on Computing: A personal Perspective Edsger W. Dijkstra, 2012-12-06 Since the summer of 1973 when I became a Burroughs Research Fellow my life has been very different from what it had been before The daily routine changed instead of going to the University each day where I used to spend most of my time in the company of others I now went there only one day a week and was most of the time that is when not travelling alone in my study In my solitude mail and the written word in general became more and more important The circumstance that my employer and I had the Atlantic Ocean between us was a further incentive to keep a fairly complete record of what I was doing The public part of that output found its place in what became known as the EWD series which can be viewed as a form of scientific correspondence possible since the advent of the copier That same copier makes it hard to estimate its actual distribution I myself made about two dozen copies of my texts but their recipients were welcome to act as further nodes of the distribution tree The decision to publish a selection from the EWD series in book form was at first highly embarrassing but as the months went by I got used to the idea As soon as some guiding principles had been adopted preferably not published elsewhere as varied and as representative as possible etc

Edsger Wybe Dijkstra Krzysztof R. Apt, Tony Hoare, 2022-07-14 Edsger Wybe Dijkstra 1930 2002 was one of the most influential researchers in the history of computer science making fundamental contributions to both the theory and practice of computing Early in his career he proposed the single source shortest path algorithm now commonly referred to as Dijkstra's algorithm He wrote with Jaap Zonneveld the first ALGOL 60 compiler and designed and implemented with his colleagues the influential THE operating system Dijkstra invented the field of concurrent algorithms with concepts such as mutual exclusion deadlock detection and synchronization A prolific writer and forceful proponent of the concept of structured programming he convincingly argued against the use of the Go To statement In 1972 he was awarded the ACM Turing Award for fundamental contributions to programming as a high intellectual challenge for eloquent insistence and practical demonstration that programs should be composed correctly not just debugged into correctness for illuminating perception of problems at the foundations of program design Subsequently he invented the concept of self stabilization relevant to fault tolerant computing He also devised an elegant language for nondeterministic programming and its weakest precondition semantics featured in his influential 1976 book *A Discipline of Programming* in which he advocated the development of programs in concert with their correctness proofs In the later stages of his life he devoted much attention to the development and presentation of mathematical proofs providing further support to his long held view that the programming process should be viewed as a mathematical activity In this unique new book 31 computer scientists including five recipients of the Turing Award present and discuss Dijkstra's numerous contributions to computing science and assess their impact Several authors knew Dijkstra as a friend teacher lecturer or colleague Their biographical essays and tributes provide a fascinating multi author picture of Dijkstra from the early days of his career up to the end of his life

Verification Timothy T.R. Colburn, J.H. Fetzer, R.L. Rankin, 2012-12-06 Among the most important problems confronting computer science is that of developing a paradigm appropriate to the discipline Proponents of formal methods such as John McCarthy C A R Hoare and Edgar Dijkstra have advanced the position that computing is a mathematical activity and that computer science should model itself after mathematics Opponents of formal methods by contrast suggest that programming is the activity which is fundamental to computer science and that there are important differences that distinguish it from mathematics which therefore cannot provide a suitable paradigm Disagreement over the place of formal methods in computer science has recently arisen in the form of renewed interest in the nature and capacity of program verification as a method for establishing the reliability of software systems A paper that appeared in Communications of the ACM entitled Program Verification The Very Idea by James H Fetzer triggered an extended debate that has been discussed in several journals and that has endured for several years engaging the interest of computer scientists both theoretical and applied and of other thinkers from a wide range of backgrounds who want to understand computer science as a domain of inquiry The editors of this collection have brought together many of the most interesting and important studies that contribute to answering questions about the nature and the limits of computer science These include early papers advocating the mathematical paradigm by McCarthy Naur R Floyd and Hoare in Part I others that elaborate the paradigm by Hoare Meyer Naur and Scherlis and Scott in Part II challenges limits and alternatives explored by C Floyd Smith Blum and Naur in Part III and recent work focusing on formal verification by DeMillo Lipton and Perlis Fetzer Cohn and Colburn in Part IV It provides essential resources for further study This volume will appeal to scientists philosophers and laypersons who want to understand the theoretical foundations of computer science and be appropriately positioned to evaluate the scope and limits of the discipline Informatics Curricula and Teaching Methods Lillian Cassel, R. Reis, 2013-04-17 Several aspects of

informatics curricula and teaching methods at the university level are reported in this volume including Challenges in defining an international curriculum The diversity in informatics curricula Computing programs for scientists and engineers Patterns of curriculum design Student interaction Teaching of programming Peer review in education This book contains a selection of the papers presented at the Working Conference on Informatics Curricula Teaching Methods and Best Practice ICTEM 2002 which was sponsored by the International Federation for Information Processing IFIP Working Group 3.2 and held in Florianópolis Brazil in July 2002 The working groups were organized in three parallel tracks Working Group 1

An Algebraic Approach to Compiler Design Augusto Sampaio,1997 This book investigates the design of compilers for procedural languages based on the algebraic laws which these languages satisfy The particular strategy adopted is to reduce an arbitrary source program to a general normal form capable of representing an arbitrary target machine This is achieved by a series of normal form reduction theorems which are proved algebraically from the more basic laws The normal form and the related reduction theorems can then be instantiated to design compilers for distinct target machines This constitutes the main novelty of the author s approach to compilation together with the fact that the entire process is formalised within a single and uniform semantic framework of a procedural language and its algebraic laws Furthermore by mechanising the approach using the OBJ3 term rewriting system it is shown that a prototype compiler is developed as a byproduct of its own proof of correctness

Universal Smart Grid Agent for Distributed Power Generation Management Eric MSP Veith, 2017 Somewhere there is always wind blowing or the sun shining This maxim could lead the global shift from fossil to renewable energy sources suggesting that there is enough energy available to be turned into electricity But the already impressive numbers that are available today along with the European Union's 20/20/20 goal to power 20% of the EU energy consumption from renewables until 2020 might mislead us over the problem that the go to renewables readily available rely on a primary energy source mankind cannot control the weather At the same time the notion of the smart grid introduces a vast array of new data coming from sensors in the power grid at wind farms power plants transformers and consumers The new wealth of information might seem overwhelming but can help to manage the different actors in the power grid This book proposes to view the problem of power generation and distribution in the face of increased volatility as a problem of information distribution and processing It enhances the power grid by turning its nodes into agents that forecast their local power balance from historical data using artificial neural networks and the multi part evolutionary training algorithm described in this book They pro actively communicate power demand and supply adhering to a set of behavioral rules this book defines and finally solve the 0/1 knapsack problem of choosing offers in such a way that not only solves the disequilibrium but also minimizes line loss by elegant modeling in the Boolean domain The book shows that the Divide et Impera approach of a distributed grid control can lead to an efficient reliable integration of volatile renewable energy sources into the power grid

Error-Free Polynomial Matrix Computations E.V. Krishnamurthy, 2012-12-06 This book is written as an introduction to polynomial matrix computations It is a companion volume to an earlier book on Methods and Applications of Error Free Computation by R T Gregory and myself published by Springer Verlag New York 1984 This book is intended for seniors and graduate students in computer and system sciences and mathematics and for researchers in the fields of computer science numerical analysis systems theory and computer algebra Chapter I introduces the basic concepts of abstract algebra including power series and polynomials This chapter is essentially meant for bridging the gap between the abstract algebra and polynomial matrix computations Chapter II is concerned with the evaluation and interpolation of polynomials The use of these techniques for exact inversion of polynomial matrices is explained in the light of currently available error free computation methods In Chapter III the principles and practice of Fourier evaluation and interpolation are described In particular the application of error free discrete Fourier transforms for polynomial matrix computations is considered

Adaptive Signal Processing Thomas S. Alexander, 2012-12-06 The creation of the text really began in 1976 with the author being involved with a group of researchers at Stanford University and the Naval Ocean Systems Center San Diego At that time adaptive techniques were more laboratory and mental curiosities than the accepted and pervasive categories of signal processing that they have become Over the last 10 years adaptive filters have become standard components in telephony data communications and signal detection and tracking systems Their use and consumer acceptance will undoubtedly only increase in the future The mathematical principles underlying adaptive signal processing were initially fascinating and were my first experience in seeing applied mathematics work for a paycheck Since that time the application of even more advanced mathematical techniques have kept the area of adaptive signal processing as exciting as those initial days The text seeks to be a bridge between the open literature in the professional journals which is usually quite concentrated concise and advanced and the graduate classroom and research environment where underlying principles are often more important

Algebraic Approaches to Program Semantics Ernest G. Manes, Michael A. Arbib, 2012-12-06 In the 1930s mathematical logicians studied the notion of effective computability using such notions as recursive functions A calculus and Turing machines The 1940s saw the construction of the first electronic computers and the next 20 years saw the evolution of higher level programming languages in which programs could be written in a convenient fashion independent thanks to compilers and interpreters of the architecture of any specific machine The development of such languages led in turn to the general analysis of questions of syntax structuring strings of symbols which could count as legal programs and semantics determining the meaning of a program for example as the function it computes in transforming input data to

output results An important approach to semantics pioneered by Floyd Hoare and Wirth is called assertion semantics given a specification of which assertions preconditions on input data should guarantee that the results satisfy desired assertions postconditions on output data one seeks a logical proof that the program satisfies its specification An alternative approach pioneered by Scott and Strachey is called denotational semantics it offers algebraic techniques for characterizing the denotation of i e the function computed by a program the properties of the program can then be checked by direct comparison of the denotation with the specification This book is an introduction to denotational semantics More specifically we introduce the reader to two approaches to denotational semantics the order semantics of Scott and Strachey and our own partially additive semantics
