Measure of the Moon Zdenek Kopal, C.L. Goudas, 2012-12-06 After many decades spent in astronomical semi obscurity the Moon has of late suddenly emerged to claim renewed interest on the part of the students of astronomy as well as of other branches of physical science and technology and the reasons which brought this about are indeed of historical significance From time immemorial astronomy has been debarred from the status of a genuine experimental science by the utter remoteness of the objects of its study With the exception of meteors those small freaks of cosmic matter intercepted by the Earth on its perpetual journey through space the properties of all celestial bodies outside the gravitational confines of our planet could be studied only at a distance namely from the effect of attraction exerted by their masses or from the ciphered message of their light brought to us by nimble footed photons across the intervening gaps of space A dramatic emergence of long range rockets in the last decade bids fair to bring about a profound change in this situation On September 13 1959 a memorable date in the history of human endeavour a man made missile of Russian origin crash landed on the surface of the Moon in the region of its Mare Imbrium and thus ended the age long separation of the Earth and its only natural satellite which lasted not less than 4 billion years
