Debris Program examines NASA's efforts to understand the meteoroid and orbital debris environment identifies what NASA is and is not doing to mitigate the risks posed by this threat and makes recommendations as to how they can improve their programs While the report identified many positive aspects of NASA's MMOD programs and efforts including responsible use of resources it recommends that the agency develop a formal strategic plan that provides the basis for prioritizing the allocation of funds and effort over various MMOD program needs Other necessary steps include improvements in long term modeling better measurements more regular updates of the debris environmental models and other actions to better characterize the long term evolution of the debris environment

withstand the hypervelocity impacts of micrometeoroids and orbital debris that strike its many surfaces In order to design and implement shielding which will prevent hull penetration or other operational losses NASA must first model the orbital debris and micrometeoroid environment Based upon this environment special multi stage shields called Whipple and Enhanced Stuffed Whipple Shields are developed and implemented to protect the ISS surfaces Ballistic limit curves that establish shield failure criteria are determined via ground testing These curves are functions of material strength shield spacing projectile size shape and density as well as a number of other variables The combination of debris models and ballistic limit equations allows NASA to model risk to the ISS using a hydrocode called BUMPER This thesis modifies and refines existing ballistic limit equations for U S Laboratory Module shields to account for the effects of the projectile debris micro meteoroid densities Using these refined ballistic limit equations this thesis also examines alternative shielding materials and configurations to optimize shield design for minimum mass and maximum stopping potential proposing alternate shield designs for future NASA ground testing A final goal of this thesis is to provide the Department of Defense a background in satellite shield theory and design in order to improve protection against micrometeoroid and orbital debris impacts on future space based national systems

Fractal Risk Assessment of ISS Propulsion Module in Meteoroid and Orbital Debris Environments National Aeronautics and Space Administration (NASA),2018-05-31 A unique and innovative risk assessment of the International Space Station ISS Propulsion Module is conducted using fractal modeling of the Module's response to the meteoroid and orbital debris environments Both the environment models and structural failure modes due to the resultant hypervelocity impact phenomenology as well as Module geometry are investigated for fractal applicability

The fractal risk assessment methodology could produce a greatly simplified alternative to current methodologies such as BUMPER analyses while maintaining or increasing the number of complex scenarios that can be assessed As a minimum this innovative fractal approach will provide an independent assessment of existing methodologies in a unique way Mog Robert A Marshall Space Flight Center RISK METEORIDS FRACTALS INTERNATIONAL SPACE STATION STRUCTURAL FAILURE SPACE DEBRIS ASSESSMENTS FAILURE MODES ENVIRONMENT MODELS HYPERVELOCITY IMPACT PHENOMENOLOGY
