Superalloys Matthew J. Donachie, Stephen J. Donachie, 2002 This book covers virtually all technical aspects related to the selection processing use and analysis of superalloys The text of this new second edition has been completely revised and expanded with many new figures and tables added In developing this new edition the focus has been on providing comprehensive and practical coverage of superalloys technology Some highlights include the most complete and up to date presentation available on alloy melting Coverage of alloy selection provides many tips and guidelines that the reader can use in identifying an appropriate alloy for a specific application The relation of properties and microstructure is covered in more detail than in previous books

Handbook of Thermoprocessing Technologies Axel von Starck, Alfred Mühlbauer, Carl Kramer, 2005 In Europe thermoprocessing is the third largest energy consumption sector following traffic and room heating Its structure is very much diversified and complex Therefore it is split into a large number of subdivisions each of them having a high importance for the industrial economy Accordingly we find the application know how for the design and the execution of respective equipment represented by a multitude of small but very specialized and significant companies and their experts As a result there was only little chance to find a comprehensive survey of the practical side of this technology so far This gap is now filled by the new Handbook of Thermoprocessing Technologies based on the contributions of many highly experienced outstanding engineers working in this field The main intention of this book is the presentation of practical thermal processing for the improvement of material and parts in industrial application Additionally a summary of respective thermal and material science fundamentals is given as well as basic fuel related and electrical engineering knowledge for this technology and finally design aspects components and safety requirements for the necessary heating installations are covered In conclusion a very wide and competent state of the art description is now available for all manufacturers and users of thermoprocessing equipment But also specialists from neighbouring fields students and all those who are generally interested in this important but widely unknown technology will find a quick survey here as well as a very profound expertise

Controlled Atmospheres for Heat Treatment R. Nemenyi, 2013-10-22 Controlled Atmospheres for Heat Treatment describes the reaction complexities in heat treatment of metals under controlled atmosphere Organized into 13 chapters this book begins with the methods and classifications of heat treatment in controlled atmospheres This topic is followed by the most popular atmospheres of heat treatment namely nitrogen and vacuum The subsequent chapters deal with the components of heat treatment atmospheres such as exogas nitrogen base of monogas

endogas and ammonia The discussion then shifts to special gas atmospheres including steam and those produced by cracking organic liquids This book also covers several heat treatment processes such as annealing hardening tempering and heat treatment of powder metallurgical products in controlled atmospheres A chapter describes the common methods used in protective gas techniques The concluding chapter presents some dangers associated with controlled atmospheres and their corresponding technical safety precautions
