Resinography Theodore Rochow, 2012-12-06 Resinography is a strange new word to many people Like all scientific terms it is a word coined for a specific purpose to indicate in this case that resins polymers and plastics write their own history on the molecular and other structural levels The word indicates further that anyone trained and equipped to ask the right questions by means of instruments and techniques will be able to read that history That person must have sufficient training and experience to interpret the answers of course and he or she needs to have the temperament of a detective But in the end as readers of this book will discover one is able to identify the material to determine its history of treatment and to learn much about its possible field of usefulness Obviously the resinographer seeks to do the same thing with resins polymers and plastics that the metallographer does with metals and their alloys Often the investigative techniques and the instruments too are similar but sometimes they are decidedly different Perhaps it would be best to say that resinography and metallography and petrography as well share a common origin and that origin is deeply rooted in microscopy The grandfather of all three ographies was Henry Clifton Sorby 1826 1908 2 who initiated 3 metallography and petrography and was the first to report on the microstructure of a resin amber a natural fossil resin **Resinographic Methods** ,1964

An Introduction to Microscopy by Means of Light, Electrons, X-Rays, or Ultrasound Eugene Rochow, 2012-12-06 Many people look upon a microscope as a mere instrument l to them microscopy is instrumentation Other people consider a microscope to be simply an aid to the eye to them microscopy is primarily an expansion of macroscopy In actuality microscopy is both objective and subjective it is seeing through an instrument by means of the eye and more importantly the brain The function of the brain is to interpret the eye's image in terms of the object's structure Thought and experience are required to distinguish structure from artifact It is said that Galileo 1564-1642 had his associates first look through his telescope microscope at very familiar objects to convince them that the image was a true representation of the object Then he would have them proceed to hitherto unknown worlds too far or too small to be seen with the unaided eye Since Galileo's time light microscopes have been improved so much that performance is now very close to theoretical limits Electron microscopes have been developed in the last four decades to exhibit thousands of times the resolving power of the light microscope Through the news media everyone is made aware of the marvelous microscopical accomplishments in imagery However little or no hint is given as to what parts of the image are derived from the specimen itself and what parts are from the instrumentation to say nothing of the changes made during preparation of the specimen
