*Pavlov's Physiology Factory* Daniel P. Todes, 2003-04-29 Russian physiologist and Nobel Prize winner Ivan Pavlov is most famous for his development of the concept of the conditional reflex and the classic experiment in which he trained a dog to salivate at the sound of a bell In Pavlov's Physiology Factory Experiment Interpretation Laboratory Enterprise Daniel P. Todes explores Pavlov's early work in digestive physiology through the structures and practices of his landmark laboratory the physiology department of the Imperial Institute for Experimental Medicine In Lectures on the Work of the Main Digestive Glands for which Pavlov won the Nobel Prize in 1904 the scientist frequently referred to the experiments of his coworkers and stated that his conclusions reflected the deed of the entire laboratory This novel claim caused the prize committee some consternation Was he alone deserving of the prize Examining the fascinating content of Pavlov's scientific notes and correspondence unpublished memoirs and laboratory publications Pavlov's Physiology Factory explores the importance of Pavlov's directorship of what the author calls a physiology factory and illuminates its relationship to Pavlov's Nobel Prize winning work and the research on conditional reflexes that followed it Todes looks at Pavlov's performance in his various roles as laboratory manager experimentalist entrepreneur and scientific visionary He discusses changes wrought by

government and commercial interests in science and sheds light on the pathways of scientific development in Russia making clear Pavlov's personal achievements while also examining his style of laboratory management Pavlov's Physiology Factory thus addresses issues of importance to historians of science and scientists today big versus small science the dynamics of experiment and interpretation and the development of research cultures

**Protein Hydrolysates in Biotechnology** Vijai K. Pasupuleti, Arnold L. Demain, 2010-08-28 Protein hydrolysates otherwise commonly known as peptones or peptides are used in a wide variety of products in fermentation and biotechnology industries The term peptone was first introduced in 1880 by Nagelli for growing bacterial cultures However later it was discovered that peptones derived from the partial digestion of proteins would furnish organic nitrogen in readily available form Ever since peptones which are commonly known as protein hydrolysates have been used not only for growth of microbial cultures but also as nitrogen source in commercial fermentations using animal cells and recombinant microorganisms for the production of value added products such as therapeutic proteins hormones vaccines etc Today the characterization screening and manufacturing of protein hydrolysates has become more sophisticated with the introduction of reliable analytical instrumentation high throughput screening techniques coupled with statistical design approaches novel enzymes and efficient downstream processing equipment This has enabled the introduction of custom built products for specialized applications in diverse fields of fermentation and biotechnology such as the following 1 Protein hydrolysates are used as much more than a simple nitrogen source For example the productivities of several therapeutic drugs made by animal cells and recombinant microorganisms have been markedly increased by use of protein hydrolysates This is extremely important when capacities are limited 2 Protein hydrolysates are employed in the manufacturing of vaccines by fermentation processes and also used as vaccine stabilizers

*Membrane Transport Mechanism* Reinhard Krämer, Christine Ziegler, 2014-03-13 This book provides a molecular view of membrane transport by means of numerous biochemical and biophysical techniques The rapidly growing numbers of atomic structures of transporters in different conformations and the constant progress in bioinformatics have recently added deeper insights The unifying mechanism of energized solute transport across membranes is assumed to

consist of the conformational cycling of a carrier protein to provide access to substrate binding sites from either side of a cellular membrane. Due to the central role of active membrane transport, there is considerable interest in deciphering the principles of one of the most fundamental processes in nature: the alternating access mechanism. This book brings together particularly significant structure-function studies on a variety of carrier systems from different transporter families: Glutamate symporters, LeuT-like fold transporters, MFS transporters, and SMR/RND exporters, as well as ABC-type importers. The selected examples impressively demonstrate how the combination of functional analysis, crystallography, investigation of dynamics, and computational studies has made it possible to create a conclusive picture or, more precisely, a molecular movie. Although we are still far from a complete molecular description of the alternating access mechanism, remarkable progress has been made from static snapshots towards membrane transport dynamics.

**Ivan Pavlov** Daniel Philip Todes, 2014. This is a definitive, deeply researched biography of Russian physiologist Ivan Pavlov (1849-1936) and is the first scholarly biography to be published in any language. The book is Todes's magnum opus, which he has been working on for some twenty years. Todes makes use of a wealth of archival material to portray Pavlov's personality, life, times, and scientific work. Combining personal documents with a close reading of scientific texts, Todes fundamentally reinterprets Pavlov's famous research on conditional reflexes. Contrary to legend, Pavlov was not a behaviorist; a misimpression captured in the false iconic image of his training a dog to salivate to the sound of a bell. Rather, he sought to explain not simply external behaviors but the emotional and intellectual life of animals and humans. This iconic objectivist was actually a profoundly anthropomorphic thinker whose science was suffused with his own experiences, values, and subjective interpretations. This book is also a traditional life-and-times biography that weaves Pavlov into some 100 years of Russian history, particularly that of its intelligentsia, from the emancipation of the serfs to Stalin's time. Pavlov was born to a family of priests in provincial Ryazan, before the serfs were emancipated, made his home and professional success in the glittering capital of St. Petersburg in late imperial Russia, suffered the cataclysmic destruction of his world during the Bolshevik seizure of power and civil war of 1917-1921, rebuilt his life in his 70s as a prosperous dissident during the Leninist 1920s, and flourished professionally as never before in 1929-1936 during the industrialization revolution and terror of Stalin. Todes's story of this powerful personality and extraordinary man is based upon interviews with surviving coworkers and family members, along with never-before-analyzed taped interviews from the 1960s and 1970s, examination of hundreds of scientific works.
