*Protostars & Planets II* David C. Black, Mildred Shapley Matthews, 1985      *Protostars and Planets II* Joseph A. Burns, 1985      **Protostars and Planets VI** Henrik Beuther, Ralf S. Klessen, Cornelis Petrus Dullemond, Thomas K. Henning, 2014-12-18 Proceedings of a conference held in Heidelberg Germany July 15 20 2013      Theory of Accretion Disks 2 Wolfgang J. Duschl, Juhan Frank, F. Meyer, Emmi Meyer-Hofmeister, Werner M. Tscharnuter, 2012-12-06 Accretion disks in astrophysics represent the characteristic flow by which compact bodies accrete mass from their environment Their intrinsically high luminosity and recent progress in observational accessibility at all wavelength bands have led to rapidly growing awareness of their importance and made them the object of intense research on widely different scales ranging from binary stars to young stellar objects and active galactic nuclei This book contains the proceedings of the NATO Advanced Workshop on Theory of Accretion Disks 2 for which some of the most active researchers in the different fields came together at the Max Planck Institut for Astrophysics in Garching in March 1993 Its reviews and contributions give an up to date account of the present status of our understanding and provide a stimulating challenge in discussions of open questions in a rapidly developing field      Meteorites and the Early Solar System II Dante S. Lauretta, Harry Y. McSween, 2006-07 They range in size from microscopic particles to masses of many tons The geologic diversity of asteroids and other rocky bodies of the solar system are displayed in the enormous variety of textures and mineralogies observed in meteorites The composition chemistry and mineralogy of primitive meteorites collectively provide evidence for a wide variety of chemical and physical processes This book synthesizes our current understanding of the early solar system summarizing information about processes that occurred before its formation It will be valuable as a textbook for graduate education in planetary science and as a reference for meteoriticists and researchers in allied fields worldwide      **Photochemistry of Planetary Atmospheres** Yuk Ling Yung, William B. DeMore, 1999 This valuable reference presents detailed studies of eleven planetary atmospheres four for the giant planets Jupiter Saturn Uranus and Neptune four for the small bodies Io Titan Triton and Pluto and three for the terrestrial planets Mars Venus and Earth Also using the database provided by recent space missions supplemented by Earth based observations the authors offer an extensive survey of the principal chemical cycles that control the present composition and past history of planetary atmospheres      **Development of a Numerical Simulation Method for Rocky Body Impacts and Theoretical Analysis of Asteroidal Shapes** Keisuke Sugiura, 2020-03-17 This book describes numerical simulations of collisions between asteroids based on a unique numerical code developed by the author The code accurately solves the elastic dynamic equations and describes the effects of fracture and friction which makes it possible to investigate the shapes of impact outcomes produced by asteroid collisions and subsequent gravitational accumulation of fragments The author parallelizes the code with high parallelization efficiency accordingly it can be used to conduct high resolution simulations with the aid of supercomputers and clarify the shapes of small remnants produced through the

catastrophic destruction of asteroids The author demonstrates that flat asteroids can only be produced by impacts involving objects with similar mass and low velocity which suggests that the flat asteroids in our solar system were created in the planet formation era and have kept their shapes until today The author also shows that asteroid collisions under certain conditions can produce the extremely elongated shape of an interstellar minor body 1I Oumuamua In brief the book offers a comprehensive investigation of asteroid impacts and shapes making it a uniquely valuable resource **Meteorites,**

**Comets, and Planets** A.M. Davis, 2005-11-21 Volume 1 provides a broad overview of the chemistry of the solar system It includes chapters on the origin of the elements and solar system abundances the solar nebula and planet formation meteorite classification the major types of meteorites important processes in early solar system history geochemistry of the terrestrial planets the giant planets and their satellite comets and the formation and early differentiation of the Earth This volume is intended to be the first reference work one would consult to learn about the chemistry of the solar system Reprinted individual volume from the acclaimed Treatise on Geochemistry 10 Volume Set ISBN 0 08 043751 6 published in 2003

**Theory of Accretion Disks** F. Meyer, Wolfgang J. Duschl, Juhan Frank, Emmi Meyer-Hofmeister, 2012-12-06 With the advent of space observatories and modern developments in ground based astronomy and concurrent progress in the theoretical understanding of these observations it has become clear that accretion of material on to compact objects is an ubiquitous mechanism powering very diverse astrophysical sources ranging in size and luminosity by many orders of magnitude A problem common to these systems is that the material accreted must in general get rid of its angular momentum and this leads to the formation of an Accretion Disk which allows angular momentum re distribution and converts potential energy into radiation with an efficiency which can be higher than the nuclear burning yield These systems range in size from quasars and active galactic nuclei to accretion disks around forming stars and the early solar system and to compact binaries such as cataclysmic variables and low mass X ray binaries Other objects that should be mentioned in this context are 88433 the black hole binary candidates and possibly gamma ray burst sources Observations of these systems have provided important constraints for theoretical accretion disk models on widely differing scales luminosities mass transfer rates and physical environments Astrobiology Gerda Horneck, Christa Baumstark-Khan, 2012-12-06 How did life originate in the universe How did it all start after the creation of matter and the formation of elements in the stars What are the pathways from the first organic molecules in space to the evolution of complex life forms on Earth and perhaps elsewhere And how will it all end The Universe itself sets the stage for the very interdisciplinary field of astrobiology that attempts to answer such questions the central one being What is the cosmic recipe for life Currently there are only very few known elements in this vast mosaic This book bridges a gap in the literature by bringing together leading specialists from different backgrounds who lecture on their fields with close relevance to astrobiology providing tutorial accounts that lead all the way to the forefront of research The book will thus be useful for students lecturers and researchers alike *Planetary Sciences*

National Academy of Sciences, Division on Engineering and Physical Sciences, Commission on Engineering and Technical Systems, 1991-02-01 This book contains the proceedings from a workshop on planetary sciences sponsored by the Academy of Sciences of the USSR and the National Academy of Sciences The proceedings include papers written by American and Soviet scientists who examine the current theoretical understanding of how the planets were formed and how they evolved to their present state They assess the type of observations and experiments that are needed to advance understanding of the formation and evolution of the solar system based on the current theoretical framework Satellites Joseph A.

exploration     Physical Processes in Interstellar Clouds G.E. Morfill, M. Scholer, 2012-12-06 This book is the result of a meeting held in August 1986 in Irsee West Germany. As the title suggests, the aim of the meeting was to discuss physical processes in interstellar clouds, determine the current status, aims, and future direction of the research in this area. Interstellar clouds contain nearly all the mass of diffuse gas in our galaxy, some 10% of the total galactic mass. They represent the birth site for stars and the final dumping ground for matter ejected from stars, winds, explosive ejecta, and thus play an integral part in the galactic recycling of material. Not only are the clouds important for the structure and evolution of our galaxy, they are also interesting objects of study per se. Because of their vast scales (up to about 100 parsec), extreme temperatures (as low as about 100 K) and long life (estimated at about 10<sup>8</sup> years), a number of physical and chemical processes occur in these environments which we are not able to study elsewhere, certainly not in laboratories. It is for this reason that the meeting, and hence this book, was organized in such a way that firstly the latest observational results were summarized, going from the global large scales to finer details and dynamics, then progressing onwards to the processes: dynamical, chemical, electromagnetic, etc.     Physics and Chemistry of the Solar System John S. Lewis, 1997 This book is aimed at several distinct audiences: first, the upper division science major who wants an up-to-date appreciation of the present state of the planetary sciences for cultural purposes; second, the first year graduate student from any of several undergraduate disciplines who intends to take graduate courses in specialized areas of planetary sciences; and third, the practicing Ph.D. scientist with training in physics, chemistry, geology, astronomy, meteorology, biology, etc., who has a highly specialized knowledge of some portion of this material but has not had the opportunity to study the broad context within which that specialty might be applied to current problems in this field.     The 20 Years Of The Synchrotron SATURNE-2 A. Boudard, P.-A. Chamouard, 2000-03-29 The Laboratoire National SATURNE LNS was established in Saclay through the joint efforts and funds of the CEA and the CNRS IN2P3. The first proton beam from the new synchrotron SATURNE 2 was obtained in July 1978. The laboratory's activities stopped in December 1997. The main subjects of research concerned fundamental nuclear physics, more precisely the intermediate energy domain. There, nucleons could be seen individually by the probe and were possibly excited in the first baryonic resonances. N and  $\Lambda$  mesons were produced in elementary processes or in the nuclear medium. SATURNE was also seen as a polyvalent facility for other domains of physics. The laboratory was open to both the national and the international community of physicists. The LNS was an extremely powerful laboratory for accelerators and ion source developments. The synchrotrons MIMAS and SATURNE could deliver the highest intensity of polarized beams: protons and deuterons in the GeV range, and also a variety of other projectiles. This book contains the contributions to a colloquium held in Paris in May 1998. It synthesizes the various subjects of the research activities driven by SATURNE 2 and presents the progress of accelerator physics and the impact of the LNS through its various collaborations and studies. It also provides the starting point for bibliographical research on projects carried out with this accelerator.

*Procs Of The 21st Century Chinese Astronomy Conf: Dedicated To Prof C C Lin* K L Chan, K S Cheng, 1997-10-22 As a country with 5000 years of history China has made tremendous contributions to astronomy The 21st century marks the beginning of a new era for the astronomy of that country This is the proceedings of a conference held to honour Prof C C Lin the leading Chinese astronomer in the world academic community on his 80th birthday *The Origin of Stars and Planetary Systems* Charles J. Lada, N.D. Kylafis, 2012-12-06 A few years after the publication of *The Physics of Star Formation and Early Stellar Evolution* we received a request from the publisher for an up dated second edition of this popular reference book As originally intended the volume had proved to be a useful text book for graduate astronomy courses and seminars which dealt with topics related to stellar origins The book was based on a series of lectures delivered by a distinguished group of leading researchers at a NATO Advanced Study Institute ASI held in May 1990 on the island of Crete Greece The primary goal of the ASI was in fact to produce a book which would simultaneously provide a broad and systematic overview of as well as a rigorous introduction to the fundamental physics and astronomy at the heart of modern research in star formation and early stellar evolution However by 1995 concern had arisen among those who used the text as a reference for graduate seminars and courses that the book would need to be updated to stay abreast of the discoveries and progress in this rapidly evolving field After some discussion we concluded that a new edition of the book was warranted and that the goal of producing a new edition would be best accomplished by organizing a second ASI in Crete to review the progress in star formation research
