Redefining Geometrical Exactness Descartes Transformation Of The Early Modern Concept Of Construction:

Redefining Geometrical Exactness H. J. M. Bos, 2001 Until the 17th century rigor and exactness in mathematics meant geometry and Euclid Other means of confirming results such as computation were considered inferior to the traditional constructions using ruler and compass In 1637 Descartes introduced what is now called analytical geometry which made algebraic methods equal to geometry in the methods of mathematics In this detailed study Bos explores the origins of what is meant by rigor in mathematics and how that definition evolved to include the use of new geometric and algebraic methods

Oxford Studies in Early Modern Philosophy, Volume X Donald Rutherford, 2021 Oxford Studies in Early Modern Philosophy is an annual series presenting a selection of the best current work in the history of early modern philosophy It focuses on the seventeenth and eighteenth centuries the extraordinary period of intellectual flourishing that begins very roughly with Descartes and his contemporaries and ends with Kant It also publishes papers on thinkers or movements outside of that framework provided they are important in illuminating early modern thought The articles in OSEMP will be of importance to specialists within the discipline but the editors also intend that they should appeal to a larger audience of philosophers intellectual historians and others who are interested in the development of modern thought How Modern Science Came Into the World H. F. Cohen, 2010 Once upon a time The Scientific Revolution of the 17th century was an innovative concept that inspired a stimulating narrative of how modern science came into the world Half a century later what we now know as the master narrative serves rather as a strait jacket so often events and contexts just fail to fit in No attempt has been made so far to replace the master narrative H Floris Cohen now comes up with precisely such a replacement Key to his path breaking analysis cum narrative is a vision of the Scientific Revolution as made up of six distinct yet narrowly interconnected revolutionary transformations each of some twenty five to thirty years duration This vision enables him to explain how modern science could come about in Europe rather than in Greece China or the Islamic world It also enables him to explain how half way into the 17th century a vast crisis of legitimacy could arise and in the end be overcome

Phenomenology and the Human Positioning in the Cosmos Anna-Teresa Tymieniecka, 2012-10-11 The classic conception of human transcendental consciousness assumes its self supporting existential status within the horizon of life world nature and earth Yet this assumed absoluteness does not entail the nature of its powers neither their constitutive force This latter call for an existential source reaching beyond the generative life world network Transcendental consciousness having lost its absolute status its point of reference it is the role of the logos to lay down the harmonious positioning in the cosmic sphere of the all establishing an original foundation of phenomenology in the primogenital onto-poiesis of life **The Cambridge Companion to Newton** Rob Iliffe, George E. Smith, 2016-04-07 This new edition includes three updated chapters a revised bibliography new introduction and three entirely new chapters **Mathematics Going Forward** Jean-Michel Morel, Bernard Teissier, 2023-05-13 This volume is an original collection of articles by 44 leading mathematicians

on the theme of the future of the discipline The contributions range from musings on the future of specific fields to analyses of the history of the discipline to discussions of open problems and conjectures including first solutions of unresolved problems Interestingly the topics do not cover all of mathematics but only those deemed most worthy to reflect on for future generations These topics encompass the most active parts of pure and applied mathematics including algebraic geometry probability logic optimization finance topology partial differential equations category theory number theory differential geometry dynamical systems artificial intelligence theory of groups mathematical physics and statistics The Routledge Companion to Eighteenth Century Philosophy Aaron Garrett, 2014-03-21 The Eighteenth century is one of the most important periods in the history of Western philosophy witnessing philosophical scientific and social and political change on a vast scale In spite of this there are few single volume overviews of the philosophy of the period as a whole The Routledge Companion to Eighteenth Century Philosophy is an authoritative survey and assessment of this momentous period covering major thinkers topics and movements in Eighteenth century philosophy Beginning with a substantial introduction by Aaron Garrett the thirty five specially commissioned chapters by an outstanding team of international contributors are organised into seven clear parts Context and Movements Metaphysics and Understanding Mind Soul and Perception Morals and Aesthetics Politics and Society Philosophy in relation to the Arts and Sciences Major Figures Major topics and themes are explored and discussed ranging from materialism free will and personal identity to the emotions the social contract aesthetics and the sciences including mathematics and biology The final section examines in more detail three figures central to the period Hume Rousseau and Kant As such The Routledge Companion to Eighteenth Century Philosophy is essential reading for all students of the period both in philosophy and related disciplines such as politics literature history and religious studies Visioning Technologies Graham Cairns, 2016-12-08 Visioning Technologies brings together a collection of texts from leading theorists to examine how architecture has been and is reframed and restructured by the visual and theoretical frameworks introduced by different technologies of sight understood to include orthographic projection perspective drawing telescopic devices photography film and computer visualization amongst others Each chapter deals with its own area and historical period of expertise organized sequentially to mark out and analyse the historical evolution of how architecture has been transformed by technologically induced shifts in human perception from the 15th century until today This book underlines the way in which architectural forms and design processes have developed historically in conjunction with the systems of sight we manufacture technologically and suggests this continues today Paradoxically it is premised on the argument that these technological systems tend in their initial formulations to obtain ever greater realism in our visualizations of the physical world *Critical Views of Logic* Mirja Hartimo, Frode Kjosavik, Øystein Linnebo, 2023-10-31 This book examines positions that challenge the Fregean logic first view It raises critical questions about logic by examining various ways in which logic may be entangled with mathematics and metaphysics Is logic topic neutral and general Can we take the application of logic

for granted This book suggests that we should not be dogmatic about logic but ask similar critical questions about logic as those Kant raised about metaphysics and mathematics It challenges the Fregean logic first view according to which logic is fundamental and hence independent of any extra logical considerations Whereas Quine assimilated logic and mathematics to the theoretical parts of empirical science the present volume explores views that stop short of his thoroughgoing holism but instead take logic to be answerable to or entangled with some particular disciplines The contributions provide views that assign primacy to mathematical reasons Kantian metaphysical grounds Husserlian transcendental phenomenological reflection or normative considerations about how terms ought to be defined in various fields of empirical science or mathematics Space is thereby carved out between a Fregean position on the one hand and Quinean holism on the other Critical Views of Logic will be a key resource for academics researchers and advanced students of philosophy linguistics mathematics and computer science as well as those engaged in various fields of empirical science The chapters in this book except for chapter 4 were originally published in the journal Inquiry

Making and Breaking Mathematical Sense Roi Wagner, 2017-01-10 In line with the emerging field of philosophy of mathematical practice this book pushes the philosophy of mathematics away from questions about the reality and truth of mathematical entities and statements and toward a focus on what mathematicians actually do and how that evolves and changes over time How do new mathematical entities come to be What internal natural cognitive and social constraints shape mathematical cultures How do mathematical signs form and reform their meanings How can we model the cognitive processes at play in mathematical evolution And how does mathematics tie together ideas reality and applications Roi Wagner uniquely combines philosophical historical and cognitive studies to paint a fully rounded image of mathematics not as an absolute ideal but as a human endeavor that takes shape in specific social and institutional contexts The book builds on ancient medieval and modern case studies to confront philosophical reconstructions and cutting edge cognitive theories It focuses on the contingent semiotic and interpretive dimensions of mathematical practice rather than on mathematics claim to universal or fundamental truths in order to explore not only what mathematics is but also what it could be Along the way Wagner challenges conventional views that mathematical signs represent fixed ideal entities that mathematical cognition is a rigid transfer of inferences between formal domains and that mathematics exceptional consensus is due to the subject's underlying reality The result is a revisionist account of mathematical philosophy that will interest mathematicians philosophers and historians of science alike

Discourse on a New Method Mary Domski, Michael Dickson, 2010 Addressing a wide range of topics from Newton to Post Kuhnian philosophy of science these essays critically examine themes that have been central to the influential work of philosopher Michael Friedman Special focus is given to Friedman's revealing study of both history of science and philosophy in his work on Kant Newton Einstein and other major figures This interaction of history and philosophy is the subject of the editors manifesto and serves to both explain and promote the essential ties between two disciplines usually regarded as unrelated

The Art of Science Rossella Lupacchini, Annarita Angelini, 2014-07-22 In addition to linear perspective complex numbers and probability were notable discoveries of the Renaissance While the power of perspective which transformed Renaissance art was quickly recognized the scientific establishment treated both complex numbers and probability with much suspicion It was only in the twentieth century that quantum theory showed how probability might be molded from complex numbers and defined the notion of complex probability amplitude From a theoretical point of view however the space opened to painting by linear perspective and that opened to science by complex numbers share significant characteristics The Art of Science explores this shared field with the purpose of extending Leonardo's vision of painting to issues of mathematics and encouraging the reader to see science as an art The intention is to restore a visual dimension to

mathematical sciences an element dulled if not obscured by historians philosophers and scientists themselves
