**Addicted?** Marilyn Freimuth, 2008-05-29 Despite our associating addictions with crazy out of control behavior most addictions go unrecognized Those who suffer from addictions often misinterpret their symptoms as a sign of some other problem Health care professionals who are entrusted by society to identify such problems routinely fail to do so When addictions are recognized they are confined to substance use which overlooks the wide array of activities that engage people in an addictive manner Further when addictions are detected they are in their most advanced and difficult to treat phases In large part this is due to the all or none way we think about addiction either you are addicted or not In reality an addiction does not emerge fully formed what starts out as just having fun gradually over time becomes a problem To limit the devastation created by late stage addictions and reap the benefits of early detection this book provides questionnaires that

screen for a wide array of chemical and behavioral addictions at all stages of development Much in the same way we learned the early warning signs of cancer this book explores different ways to recognize the early and often subtle signs of addiction Unlike cancer where people rush to get treatment facing an addiction is associated with guilt and ambivalence To navigate these feelings and get help the book provides a step by step guide for how to prepare the addicted person be it oneself or someone else to change an addiction

**Cognitive and Behavioral Performance Factors in Atypical Aging** Mark L. Howe, Michael J. Stones, Charles J. Brainerd, 2012-12-06 It is a truism that as we age there are a number of underlying physiological changes conspiring to alter our level of behavioral and cognitive function ing Despite the inherent interrelatedness of these behavioral and cognitive changes all too often the papers we read confine themselves to specific isolated components of the developing process Although exceptions nat urally exist we believe that these exceptions should become rule Although an integrated approach is important in all areas of adult devel opment it is perhaps particularly germane in the study of atypical aging Here changes in overall functioning can occur in rapid succession with the synchrony of decline between different subprocesses making it difficult to factor changes in one process from changes in another For example because changes in cognitive functioning co occur with other dramatic changes in motoric response capacities it is unclear how one can effec tively study changes in the ability to cognize independent of changes in the very mechanisms ability to execute motor sequences so often used to index cognitive performance
