Sheet Metal Forming R. Pearce,1991-12-31 The pressing of sheet metal into useful shapes is a technology which requires an understanding of a wide range of subjects This text is divided into three sections processes materials and tests In Part 1 sheet metal forming is examined mainly from a mechanical engineering viewpoint firstly plasticity and anisotropy then process variables friction lubrication and temperature and finally practical aspects of forming in the press shop Part 2 deals with the main sheet alloys at varying lengths depending on their industrial popularity Certain research results showing the fallibility of the phenomenological approach are also highlighted A section of testing procedures concludes the volume

[Mechanics of Sheet Metal Forming](#) Jack Hu,Zdzislaw Marciniak,John Duncan,2002-04-17 The basic theory of sheet metal forming in the automotive appliance and aircraft industries is given This fills a gap between the descriptive treatments in most manufacturing texts and the advanced numerical methods used in computer aided design systems The book may be used by lecturers in undergraduate courses in manufacturing plentiful exercises and worked examples provide quantitative tutorial problems for students A separate but related simulation software package advertised on this page enables students to explore the limits of processes and understand the influence of different process and material variables Engineers in stamping plants and press shops find the book useful in understanding what happens during forming and why failures occur The book is also used as a text for industrial short courses that have been given in many countries Die designers and tooling engineers find the simple treatment of processes useful at the conceptual design stage and also in determining modifications needed to overcome problems indicated by detailed numerical analysis The original text published 10 years ago has been completely rewritten for this edition and newer topics such as hydroforming included Simple equations governing plastic deformation press forming bending punch stretching and deep drawing are derived and explained The aim is to provide simple applicable methods rather than complex numerical techniques for practising engineers and for students interested in

a quantitative and practical approach SIMPLIFIED STAMPING SIMULATION SOFTWARE 4S The analytical treatment in this book is used to develop simulation modules for simple cases of sheet forming such as stamping deep drawing bending and hydroforming Students can investigate the influence of tooling dimensions material properties and process variables such as friction on the outcome of operations and see from animated models how for example press loads develop during forming Applications using this package greatly enhance interest in the development of theory in the book The website <http://www.mssinternational.com> provides further information and an opportunity to run some of the modules Presents the fundamentals of sheet metal forming bending stretching press forming deep drawing and hydroforming Shows how deformation loads and process limits can be calculated using simple equations Concentrates on simple applicable methods rather than complex numerical techniques Contains many exercises worked examples and solutions Used as a reference text in undergraduate manufacturing courses as a required text in specialist graduate courses and as a course text for industrial short courses Is supported by a separate but related simulation software package described below Final Report on Sheet Metal Forming Technology: Sheet metal forming handbook Chance Vought Corporation. the most commonly used methodology for the mass production manufacture of aircraft automobiles and complex high precision parts. It illustrates several different approaches to this intricate field by taking the reader through the hows and whys of product analysis as well as the techniques for blanking punching bending deep drawing stretching material economy strip design movement of metal during stamping and tooling.

Mechanics of Sheet Metal Forming D. Koistinen, 2012-12-06

This volume records the proceedings of an international symposium on MECHANICS OF SHEET METAL FORMING: Material Behavior and Deformation Analysis. It was sponsored and held at the General Motors Research Laboratories on October 17-18, 1977. This symposium was the twenty-first in an annual series. The objective of this symposium was to discuss the research frontiers in experimental and theoretical methods of sheet metal forming analysis and also to determine directions of future research to advance technology that would be useful in metal stamping plants. Metal deformation analyses which provide guide lines for metal flanging are already in use. Moreover, recent advances in computer techniques for solving plastic flow equations and in measurements of material parameters are leading to dynamic models of many stamping operations. These models would accurately predict the stresses and strains in the sheet as a function of punch travel. They would provide the engineer with the knowledge he needs to improve die designs. The symposium papers were organized into five sessions: the state of the art, constitutive relations of sheet metal, role of friction, sheet metal formability and deformation analysis of stamping operations. We believe this volume not only summarizes the various viewpoints at the time of the symposium but also provides an outlook for materials and mechanics research in the future.

Micro Metal Forming Frank Vollertsen, 2013-05-13

Micro Metal Forming, i.e. forming of parts and features with dimensions below 1 mm, is a young area of research in the wide field of metal forming technologies, expanding the limits for applying metal forming towards micro technology. The essential challenges arise from the reduced geometrical size and the increased lot size. In order to enable potential users to apply micro metal forming in production, information about the following topics is given: tribological behavior, friction between tool and work piece as well as tool wear, mechanical behavior, strength and formability of the work piece, material durability of the work pieces, size effects, basic description of effects occurring due to the fact that the quantitative relation between different features changes with decreasing size, process windows and limits for forming processes, tool making methods, numerical modeling of processes and process chains, quality assurance and metrology. All topics are discussed with respect to the questions relevant to micro metal forming. The description comprises information from actual research and the young history of this technology branch to be used by students, scientists and engineers in industry who already have a background in metal forming and like to expand their knowledge towards miniaturization.
