The Involvement of Systemic Homeostasis in Tumour Biology Wei-Lin Jin, Hongying Pan, Qian Wang, Gerhard Schmalz, 2023-10-13 Systemic homeostatic mechanisms include several aspects such as metabolic neuroendocrine immune and physiological homeostasis Irreversible damage or reversible imbalance of such homeostatic processes may initiate cancers by altering the regulation of the molecular machinery Systemic homeostasis related genes have been found to be intimately involved in oncological processes and in

some instances have shown prognostic value. Thus, future gene targeting approaches for cancer should not only focus on classical cancer drivers but also address systemic homeostasis related genetic mechanisms. Identification of systemic homeostasis related genes with diagnostic, prognostic or therapeutic value can advance translational cancer research. Increasing numbers of research studies have reported systemic homeostasis related genes relevance to various types of cancer. For example, cancer cells have been shown to activate a critical mechanism of oxygen homeostasis hypoxia inducible factors HIFs family genes in order to adapt to the tumor microenvironment and develop into a more aggressive phenotype. In addition, methylene tetrahydrofolate dehydrogenase MTHFD family genes are involved in mitochondrial one carbon metabolism which is essential for maintaining systemic metabolic homeostasis and have recently been found overexpressed in many cancers and have been correlated to poor survival outcomes. The overexpression of transferrin family genes with iron transporting function has been linked with iron accumulation which is a known initiating factor in cancer. Another example is Forkhead box O FOXO family genes which serve as a critical regulator of immune homeostasis and can regulate cancer immunity by negatively regulating the expression of immunosuppressive gene programmed death 1 ligand 1 PD L1. Apart from these examples, other systemic homeostatic mechanisms such as glucose homeostasis, energy homeostasis, lipid homeostasis, phosphate homeostasis, cholesterol homeostasis and mineral homeostasis may also be implicated in cancer pathogenesis. Although accruing research is focused on describing systemic homeostatic mechanisms in cancer biology, several research questions remain unaddressed. The utilization of recent analytic tools and bioinformatics as systems biology approaches has the potential to address these research gaps. Therefore, in this special issue, we will collect articles focusing on the application of bioinformatics and systems biology based investigations of systemic homeostatic mechanisms in malignant diseases. Both original research and review articles are welcomed; however, publications based on the analysis on only one database will not be accepted, e.g. TCGA.
