Protein Kinases In Blood Cell Function:

Protein Kinases in Blood Cell Function Chi-Kuang Huang, Ramadan Sha'afi, 1993-02-22 Protein Kinases in Blood Cell Function provides an up to date comprehensive review of protein kinases in various types of blood cell function Blood cells discussed include T lymphocytes B lymphocytes platelets mast cells neutrophils and macrophages The book will interest pathologists physiologists oncologists hematologists leukocyte biologists and immunologists It will also benefit anyone interested in signal transduction and blood cell functions such as host defense hemostasis and immune response

Regulation of immune system cell functions by protein kinase C Noah Isakov, Amnon Altman, 2014-11-11 Members of the protein kinase C PKC family of Ser Thr kinases are encoded by nine distinct but closely related genes which give rise to more than 12 different protein isoforms via a mechanism of alternative RNA splicing Most PKC proteins are ubiquitously expressed and participate in a plethora of functions in most cell types A majority of PKC isoforms is also expressed in cells of the immune system in which they are involved in signal transduction downstream of a range of surface receptors including the antigen receptors on T and B lymphocytes PKC proteins are central to signal initiation and propagation and to the regulation of processes leading to immune cell proliferation differentiation homing and survival As a result PKC proteins directly impact on the quality and quantity of immune responses and indirectly on the host resistance to pathogens and tendency to develop immune deficiencies and autoimmune diseases A significant progress was made in recent years in understanding the regulation of PKC enzymes their mechanism of action and their role in determining immunocyte behavior This volume reviews the most significant contributions made in the field of immune cell regulation by PKC enzymes Several manuscripts are devoted to the role of distinct PKC isoforms in the regulation of selected immunocyte responses Additional manuscripts review more general mechanisms of regulation of PKC enzymes either by post translational modifications such as phosphorylation or controlled proteolysis or by interaction with different binding proteins that may alter the conformation activity and subcellular location of PKC Both types of mechanisms can introduce conformational changes in the molecule which may affect its ability to interact with cofactors ATP or substrates This topic will be followed by a discussion on the positive and negative impact of individual PKC isoforms on cell cycle regulation A second section of this volume concentrates on selected topics relevant to role of the novel PKC isoform PKC theta in T lymphocyte function PKC theta plays important and some non redundant roles in T cell activation and is a key isoform that recruits to the immunological synapse the surface membrane area in T cells that comes in direct contact with antigen presenting cells The immunological synapse is formed in T cells within seconds following the engagement of the TCR by a peptide bound MHC molecule on the surface of antigen presenting cells It serves as a platform for receptors adaptor proteins and effector molecules which assemble into multimolecular activation complexes required for signal transduction The unique ability of PKC theta to activate the NF κ B AP 1 and NF AT transcription factors is well established and recent studies contributed essential information on the

mechanisms involved in the recruitment of PKC theta to the center of the immunological synapse and the nature of its substrates and the role of their phosphorylated forms in signal transduction Additional review manuscripts will describe the unique behavior of PKC theta in regulatory T cells and its role in the regulation of other cell populations including those of the innate immune response This volume brings together leading experts from different disciplines that review the most recent discoveries and offer new perspectives on the contributions of PKC isoforms to biochemical processes and signaling events in different immune cell populations and their impact on the overall host immune response

Cellular Mechanisms in Airways Inflammation Clive P. Page, Katharine H. Banner, Domenico Spina, 2013-03-11 Airways inflammation is a complex biological phenomenon resulting from the recruitment and activation of numerous cell types Airways inflammation contributes to the pathophysiology of airways disease An understanding of the mechanisms that regulate inflammatory cell function is essential for the development of novel anti inflammatory drugs for the treatment of common respiratory diseases such as asthma and COPD This book provides a collection of valuable reviews on the major inflammatory cells involved in airways disease and examines the pharmacology of current anti inflammatory drugs used in the treatment of airways disease Moreover an insight into the development of emerging drug therapies is also highlighted This book is a must for the library of any researcher or clinician interested in the pathophysiology of airways disease

The Role of Glycans in Immune Cell

Functions Jasmeen S. Merzaban, Monica M. Burdick, Charles J. Dimitroff, 2020-05-26 Glycans represent a major constituency of post translational modifications that occur on most if not all proteins Whether on mammalian or invertebrate cell surfaces they exist as sugar chain moieties designed from the exquisite and coordinated activity of cell specific glycosylation Some of

the more common glycan structures are linked to cell surface polypeptides via an asparagine N linked residue or a serine threonine O linked residue along with a notable contingent found linked to ceramides in the lipid bilayer known as glycosphingolipids. These glycans can associate with complementary glycan binding proteins GBP or lectins to mediate and translate this carbohydrate recognition to cell function. In immunity there is increasing evidence that precise immune cell glycans are recognized by corresponding GBPs in a cell intrinsic or extrinsic manner. Unique carbohydrate recognition domains within GBPs are comprised of precisely spaced amino acid functional groups that allow for selective engagement of a particular glycan target. This structure function relationship is present in immune signaling pathways whereby glycans and GBPs on the surface of immune cells and non immune cells help control processes such as immune cell activation recognition of pathogens suppression and tissue specific migration. The diversity of glycan structures and glycosylation among individual immune cell subsets is controlled by the expression of genes involved in glycan biosynthesis including glycosyltransferases glycosidases glycan precursor biosynthetic enzymes and nucleotide sugar transporters. These genes represent more than 3% of the human genome and cell specific expression of these genes dictates a cell's glycan repertoire ultimately influencing its molecular interactions with GBPs. Altogether these emerging lines of investigation highlight the regulatory capacity of glycans in immune health and disease which in turn pave the way for novel diagnostic prognostic and therapeutic strategies.
