Recovery From Aphasia:

Redefining Recovery from Aphasia Dalia Cahana-Amitay, Martin Albert, 2015-01-07 This book focuses on two fundamental aspects of brain language relations one concerns the neural organization of language in the healthy brain the other challenges current approaches to treatment of aphasia and offers a new theory for recovery from aphasia The essence of the book lies in the phrase neural multifunctionality the constant and dynamic incorporation of non linguistic functions into language models of the intact brain The book makes the claim that language is a construction created as we use it and cannot be understood as being supported by neurally based linguistic networks only Rather language emerges from the constant and dynamic interaction among neural networks subserving cognitive affective and praxic functions with neural networks subserving lexical retrieval naming sentence processing comprehension and discourse communication conversation In persons with stroke induced aphasia neural networks for executive system function attention memory motor system function visual system function and emotion interact with neural networks for language to produce the aphasia profile and to influence recovery from aphasia Consequently neural multifunctionality in aphasia explains individual differences in the lesion deficit model and continued recovery over time redefining the concept of recovery from aphasia and offering new opportunities for treatment

New Techniques for Identifying the Neural Substrates of Language Argye Hillis, 2002 This issue includes studies demonstrating how advanced imaging techniques and new methods of recording brain function can reveal areas of the brain that are essential for specific language processes The first two papers report use of arterial spin labelling ASL perfusion MRI to identify areas of poor blood flow hypoperfusion that have impaired neural function The first paper describes a group study that demonstrates that severity of language impairment in aphasic patients is more strongly correlated with extent of hypoperfused tissue than with extent of infarct The second paper is a detailed single case study of a patient with reading impairment While conventional MRI in this patient did not reveal a lesion in regions of the brain that are thought to be crucial for reading such as angular gyrus ASL perfusion MRI revealed poor blood flow in the angular gyrus which likely accounts for the patient's deficits The third paper reports a group study that employed contrast bolus tracking Gadolinium perfusion MRI to evaluate mechanisms of early aphasia recovery Results indicate that rapid resolution of aphasia in acute stroke patients over the first three days occurs only in patients who show restored blood flow reperfusion to previously hypoperfused language cortex These results are used as a springboard for discussing the types of interventions that are likely to be useful in various stages of aphasia recovery The next paper illustrates how M Diffusion Tensor Imaging which elegantly show discrete fibre tracts and lesions within them can be used to answer questions about connections and disconnections in fibre pathways that underlie language and aphasia The final paper discusses how new methods of analysing electrical activity from the cortex recorded from implanted subdural grids can reveal areas of the brain involved in American Sign Language versus spoken English

The Effectiveness of Rehabilitation for Cognitive Deficits Peter W. Halligan, Derick T. Wade, 2005 In this book some of the leading

clinicians and cognitive neuroscientists consider the effectiveness of cognitive rehabilitation. They situate the issues within an overall context that considers the different types and levels of diagnosis and assessment, the adequacy of underlying cognitive theory for rehabilitation, and more importantly, the clinical effectiveness of current treatments to improve functional recovery. By employing an evidence-based approach that critically evaluates the published literature, the book provides for a better understanding of the strengths and limitations of the cognitive approach and hopefully a more realistic expectation of its outcome for patients with neurological deficits. The book will serve as a valuable source for a wide spectrum of professionals who deal with the neuropsychological and neurological effects of brain damage. **BOOK JACKET The Clinical Science of**

Neurologic Rehabilitation Bruce H. Dobkin, 2003. The Second Edition of this single-authored volume integrates multiple disciplines of basic and clinical research to help clinicians further develop the best possible care for the rehabilitation of patients with neurologic diseases. From the readable descriptions of the structures and functions of pathways for movement and cognition, the reader comes to understand the potential for training-induced pharmacologic and near-future biologic interventions to enhance recovery. Dr. Dobkin shows how functional neuroimaging serves as a marker for whether physical, cognitive, and neuromodulating therapies work and how they sculpt the plasticity of the brain. Themes such as how the manipulation of sensory experience can serve as a formidable tool for rehabilitation run throughout the text, built from the level of the synapse to behaviors such as grasping, walking, and thinking. From illustrating how we may one day repair the brain and spinal cord to how to retrain spared and new pathways, Dr. Dobkin draws insights from a broad swath of fundamental research to give clinicians tools they can translate into bedside practices. The book treats the medical complications and therapeutic approaches to neurologic diseases as an interconnected matrix. The management of common medical issues, impairments, and disabilities are described across diseases. Special problems posed by patients with stroke, myelopathies, brain injury, multiple sclerosis, degenerative diseases, and motor unit disorders receive individual comment. Short-term and delayed pulse interventions for patients along with clinical trials are dissected and put into perspective. The First Edition of this book was titled *Neurologic Rehabilitation*. The title has been changed to reflect Dr. Dobkin's sense that fundamental research now drives the field of neurologic rehabilitation even more than it could in 1996 when the First Edition was published. The Second Edition features entirely new chapters on functional neuroimaging of recovery, neurostimulators, and neuroprostheses, integration into the book of many new clinical and neuroscientific observations relevant to the clinician, and extensive updating and expansion of all chapters. Readers, whether clinicians serving the rehabilitation team or students or researchers in neuroscience, neurology, physical medicine, allied health, or bioengineering, will acquire new insights and tools for creative pursuits that aim to lessen the disabilities of patients. *Brain Repair After Stroke* Steven C.

Cramer, Randolph J. Nudo, 2010-10-28. Increasing evidence identifies the possibility of restoring function to the damaged brain via exogenous therapies. One major target for these advances is stroke, where most patients can be left with significant

disability Treatments have the potential to improve the victim s quality of life significantly and reduce the time and expense of rehabilitation Brain Repair After Stroke reviews the biology of spontaneous brain repair after stroke in animal models and in humans Detailed chapters cover the many forms of therapy being explored to promote brain repair and consider clinical trial issues in this context This book provides a summary of the neurobiology of innate and treatment induced repair mechanisms after hypoxia and reviews the state of the art for human therapeutics in relation to promoting behavioral recovery after stroke Essential reading for stroke physicians neurologists rehabilitation physicians and neuropsychologists

Speech and Language Disorders in Bilinguals Alfredo Ardila, Eliane Ramos, 2007 During the last years a significant number of papers books and monographs devoted to speech and language impairments in bilingual children have been published Different aspects and questions have been approached and today we have a relatively good understanding of the specific characteristics of the speech and language difficulties potentially observed in bilingual and multilingual children This interest has been significantly resulted from the potential developmental and educational consequences of bilingualism Our understanding of the communication disorders in adult populations is notoriously more limited even though over 50% of the adult population can speak at least another language in addition to his/her native language That simply means that over 50% of the communication disorders observed in adults are bilingual speech and language disorders bilingual aphasia bilingual dementias bilingual stuttering etc This book was written with the specific purpose of filling this gap The major purpose of this book has been to integrate the state of the art on the different aspects of the communication disorders observed in adult bilinguals The book is organised in such a way that an integrated perspective of bilingualism is presented from the normal conditions to the pathology from the clinical descriptions to the rehabilitation issues from the biological factors to the cultural variables
