Rudnick Developmental Cytology:

Control Mechanisms in Developmental Processes Michael Locke, 2012-12-02 Control Mechanisms in Developmental Processes covers the proceedings of the 1967 26th Symposium of The Society for Developmental Biology held in La Jolla California This book is divided into three parts encompassing 10 chapters that summarize the role of cytoplasmic units and the nucleus in developmental processes and the regulatory mechanisms The opening part of the book describes the chemical changes during the development of plastids in leaves of higher plants The book goes on discussing the nuclear and cytoplasmic controls in Neurospora morphology This compilation also examines the aspects of development growth and control in the basal bodies and flagella of Chlamydomonas reinhardtii The second part describes genetic systems in plants that serve to initiate or program the sequence in plant development and the life cycle of hybrids between somatic cells of different species A chapter discusses the genetic basis of higher plant morphogenesis by analysis of the differences between genotypes that differ from each other with respect to a single gene having a pronounced and highly specific effect upon form A discussion on the activation of protein synthesis upon fertilization and early development of animal eggs to the biochemical basis of the determination process is also included The concluding part deals with the differentiation of erythroid cells the induction of hemoglobin synthesis the regulation of heme and globin synthesis and the role of heme in the synthesis and assembly of hemoglobin This part also describes the differentiation of cells to the point where they can perform the various types of immunological reactions This book is an invaluable source for developmental biologists and researchers

Developmental Biology Michael Locke, 2014-05-12 Developmental Biology Supplement 1 Control Mechanisms in Developmental Processes focuses on the process of how organs grow and develop This book is organized into three main topics role of cytoplasmic units role of the nucleus and regulatory mechanisms This compilation specifically discusses the control mechanisms in plastid development nuclear control of morphology and possible involvement of mitochondrial DNA The mode of operation of a regulatory system in maize hooded gene in barley and regulation of the cell cycle in mammalian cells are also described This text likewise considers the development of immunocompetent cells regulatory action of estrogenic hormones and biological activity of uterine RNA This publication is suitable for biologists specialists and students concerned with developmental processes Nuclear Cytology in Relation to Development F. Developmental Studies on Giant Chromosomes W. Beermann, 2013-06-29 Earlier titles in this series have directed attention to selected questions of current theoretical or practical interest in developmental biology without special emphasis upon individual biological systems To choose giant polytene chromosomes as the common denominator of a new volume may at first sight seem to set rather arbitrary restrictions upon a coherent discussion of the basic problem of cellular differentiation However the reader will find out for himself that on the contrary such a limitation though dictated by the material focuses the analysis upon one essential point the differential release of genetic information from operational

subunits of the eukaryotic chromosome In the organization of this volume we have not striven for completeness some indeed may feel that the work on Sciarids is underrepresented but the various contributors have made every effort to render a thorough and up to date picture of the situation in their particular field and on this basis to discuss all possible angles of general biological interest Authors and editors have agreed to dedicate this volume to the memory of JACK SCHULTZ

Harvey,2000 Volume 2 of 2 **Biochemical Differentiation in Insect Glands** W. Beermann,2013-06-29 The majority of studies devoted to animal development traditionally start out from questions of morphogenesis Of course visible differentiation as well as the events leading to it should ultimately become describable in molecular terms Nevertheless even simple morphogenetic processes may have a complex biochemical basis which makes it difficult to recognize the key functions involved This difficulty obviously does not exist in the case of glands i e organs and tissues primarily concerned with and characterized by the nature of their products i e one or a few secretory proteins synthesized in huge quantities In these systems when we observe differences between different portions of a gland or when switches of the synthetic activity occur during development there is no question as to what we have to look for we are directly faced with the fact of differential protein synthesis and the problem of its control Insect glands in addition share other significant properties i e the absence of cell division during growth and concomitantly the formation of giant cells with polyploid or polytene nuclei This unique set of peculiarities can be fully exploited only if one compares various representative systems everyone of which when considered by itself might appear too exotic to invite generalization In the present volume the editors have endeavored to bring together contributions covering selected insect glands from various points of view including the developmental molecular genetic and cytogenetic aspects **Plant Tissue Culture: Theory and Practice** S.S. Bhojwani,M.K. Razdan,1996-11-08 Since the publication of the first edition in 1983 several new and exciting developments have taken place in the field of plant tissue culture which forms a major component of what is now called plant biotechnology The revised edition presents updated information on theoretical practical and applied aspects of plant tissue culture Each chapter has been thoroughly revised and as before is written in lucid language includes relevant media protocols and is profusely illustrated with self explanatory diagrams and original photographs This book includes three new chapters Variant selection Genetic Engineering and Production of Industrial Compounds and contains a complete bibliography and a glossary of terms commonly used in tissue culture literature This updated version proves to be an excellent text for undergraduate postgraduate students and teachers in various fields of plant sciences and a useful reference book for those interested in the application of any aspect of this aseptic technology **Cytology and Cell Physiology** Geoffrey Bourne,2012-12-02 Cytology and Cell Physiology Third Edition focuses on cell cytology and physiology as well as recent advances in the techniques in studying cells including microscopy It also describes cell membranes surface and physiology cytoplasmic constituents nucleus and nucleocytoplasmic reactions enzyme histochemistry and cytochemistry viruses within cells and morphology of the cancer cell Organized into 13 chapters this edition begins with a historical overview of cytology the template hypothesis of protein synthesis and the respiratory function of mitochondria It then discusses the subcellular components and their centrifugal isolation some general principles of microscopy selected physical and physicochemical methods applications of enzyme histochemistry to electron microscopy and structure and physical properties of the plasma membrane The remaining

chapters focus on the endoplasmic reticulum the Golgi apparatus the nucleus and its role in cell metabolism RNA synthesis and movement the behavior of viruses within cells and pathological changes in cells The book concludes with a chapter on the function and metabolism of cancer cells This book is highly recommended to cytologists investigators in the field of pathology and graduate students in biology biochemistry physiology and anatomy *Advances in Marine Biology*, 1976-12-14 *Advances in Marine Biology* The Role of Chromosomes in Development Michael Locke, 2014-06-05 The Role of Chromosomes in Development is a collection of papers that deals with structural patterns and functional organization of chromosomes Some papers discuss chromosomal proteins DNA replication sequences in higher animals and the implications of localized DNA synthesis in polytene chromosomes Several papers describe chromosomal RNA nuclear RNA fractions genetic control and the regulation of developmental pathways One paper concerns the bithorax series that controls the development of certain body segments of the fly in a polarized and coordinated manner reminiscent of the genes in the operons of microorganisms The bithorax genes evidently exploit and amplify a gradient arising from an anteroposterior gradient during mitotic division rates The bithorax genes produces a whole set of new substances that repress certain systems of cellular differentiation letting other systems to emerge and develop Another paper investigates the hypothesis of diploid subnuclei as the architectural subunit of the ciliate macronucleus as well as the hypothesis of allelic repression as the basis for certain examples of subnuclear differentiation The collection can prove beneficial for biochemists micro biologists bio physicists cellular researchers and academicians involved in the study of cellular biology
