pollution to the impacts of fisheries Whilst science has provided the backbone of thinking on marine conservation perhaps the biggest change over this period has been the use of an ever increasing range of techniques and disciplines to further marine conservation ends Bob Earll explores what marine conservation involves in practice by providing a synthesis of the main developments from the viewpoints of 19 leading practitioners and pioneers who have helped shape its progress and successes Their narratives highlight the diversity and richness of activity and the realities of delivering marine conservation in practice with reference to a host of projects and case studies Many of these narratives demonstrate how innovative conservationists have been often developing novel approaches to problems where little information and no frameworks exist The case studies described are based on a wide range of European and international projects This book takes an in depth look at the reality of delivering marine conservation in practice where achieving change is often a complicated process with barriers to overcome that have nothing to do with science Marine conservationists will often be working with stakeholders for whom marine conservation is not a priority This book aims to help readers describe and understand those realities and shows that successful and inspirational projects can be delivered against the odds

Syngnathid Fishes: Biology, Ecology, Physiology, Conservation and Innovative Rearing Techniques Miquel Planas, Michele Gristina, Jorge Palma, Peter R. Teske, Geng Qin, Olivia Roth, Emily Rose, 2023-11-27 Syngnathids are a large and diverse group of fishes including seahorses pipefishes seadragons and pipehorses These iconic and vulnerable fishes are distributed worldwide in warm temperate to tropical environments usually in coastal shallow water Most species are marine and strongly associated with vegetal communities or coral reefs which provide shelter and the necessary dietary resources Syngnathids have a unique reproductive mode with parental care diverse brooding structures and other special characteristics that make them highly vulnerable These iconic fishes are facing several threats namely environmental disturbances and habitat regression However many of their biological ecological and physiological characteristics have been poorly investigated and limited to a few species Despite their vulnerability to date a large number of species are listed as Data Deficient meaning they could potentially be threatened by IUCN due to inadequate or insufficient information mainly on distribution and or population status Due to the progressive regression of wild populations long term monitoring programs are necessary to evaluate population dynamics fisheries and habitat quality On the other hand these charismatic fishes especially seahorses are excellent flagship species for marine biodiversity conservation Unfortunately illegal harvesting and traffic of seahorses and other syngnathids is a fact despite CITES controls Hence the development of new tools for fish traceability and updated policies are also necessary to reduce the threats to these fishes
