Against the Tide Cornelia Dean,1999 Few aspects of American military history have been as vigorously debated as Harry Truman s decision to use atomic bombs against Japan In this carefully crafted volume Michael Kort describes the wartime circumstances and thinking that form the context for the decision to use these weapons surveys the major debates related to that decision and provides a comprehensive collection of key primary source documents that illuminate the behavior of the United States and Japan during the closing days of World War II Kort opens with a summary of the debate over Hiroshima as it has evolved since 1945 He then provides a historical overview of the events in question beginning with the decision and program to build the atomic bomb Detailing the sequence of events leading to Japan s surrender he revisits the decisive battles of the Pacific War and the motivations of American and Japanese leaders Finally Kort examines ten key issues in the discussion of Hiroshima and guides readers to relevant primary source documents scholarly books and articles **Coastal**

Defences Peter W. French,2002-01-04 Coastal Defences aims to present the broad spectrum of methods that engineers use to protect the coastline and investigates the sorts of issues that can arise as a result The first section of the book examines traditional hard techniques such as sea walls and groynes whilst the second looks at the more recent trend of using techniques more sympathetic to nature By looking at each of the main methods of coastal protection in detail the book investigates the rationale for using each method and the consequent management issues presenting a case for and against each of the techniques **Silver Strand Littoral Cell Preliminary Sediment Budget Report** ,1987 Coastal Problems

Heather Viles,Tom Spencer,2014-02-25 As coastal populations burgeon problems of erosion pollution and coastal change are becoming ever more serious and necessitate scientifically informed management strategies This authoritative new study discusses the causes of and possible solutions to some of the more pressing problems at the coast against a background of the natural geomorphological and ecological workings of coastal environments A holistic approach to the understanding of coastal problems is suggested which integrates geomorphology ecology and society through a consideration of the basic processes at work Coastal problems are caused by both human and natural impacts often working in conjunction with each other thus drawing on their wide experience of temperate and tropical coasts the authors consider all types of coastal problems ranging from those produced entirely naturally to those where the human impact dominates Extensive use is made of case studies drawn from around the world from beach erosion along the Nigerian coast to the recovery of the Vietnamese mangroves from war damage A major theme of the book is that given recent downgrading of predictions of future sea level rise it is the distinctive geomorphological ecological and societal aspects of each coast which are the vital factors Coastal

Problems brings together material vital to any attempts to understand and manage our coasts and will be of interest to all those concerned with the environment and its management

Coasts C. D. Woodroffe, 2002 Coasts are some of the most rapidly changing places on earth Understanding the natural adjustments that occur between coastal landforms and the processes that influence them is essential for the better management of coastal resources Coasts provides a necessary background in geomorphology for those studying coastal systems It describes the landforms that occur on the coast their responses to the processes that shape them and the pattern of evolution that can be determined for different types of coast over thousands of years Numerous examples from around the world are used to illustrate the variety of environments Particular attention is paid to coastal morphodynamics the co adjustment of process and form on rocky reef sandy deltaic estuarine and muddy coasts This valuable text for advanced undergraduate and graduate students is well illustrated and contains an extensive reference section It will also be of great interest to environmental scientists geologists coastal managers and planners

Beach Nourishment Juan J. Munoz-Perez, Luis Moreno, 2021-09-08 Erosion is experienced by most coastlines worldwide and it is usually attributed not only to sea level rise but also to the retention of sand in dams the occupation of dry beaches by urbanized areas the mining of sand as a building material for construction and so on Beach nourishment has evolved as the favored erosion mitigation strategy in many areas of the world The increasing number of people living on the coast the safety of those people and the high values of coastal properties are all factors that have made beach nourishment a cost effective strategy for managing erosion in many locations However a new scenario of sand scarcity and environmental care has arisen in recent decades There have been many different and interesting cases of various aspects of beach nourishment in recent years The purpose of this invited Special Issue is to publish the most exciting experience and research with respect to this topic Thus novel techniques for designing executing and controlling these kinds of works as well as different case studies and their monitoring results and conclusions have been included in order to present an updated state of the art for marine scientists researchers and engineers

Geology of Holocene Barrier Island Systems Richard A. Jr. Davis, 2012-12-06 Barrier islands represent a complex coastal system that includes a number of different sedimentary depositional environments nearshore zone beach dunes washover fans marshes tidal flats estuaries lagoons and tidal inlets The morphodynamics of these fragile coastal systems provide a further complication to this coastal type Although barrier islands comprise only 15% of the world's coastline they have received a far greater proportion of attention from the scientific and engineering community and more recently from coastal managers and environmentalists Modern barrier islands are arguably the most expensive and most vulnerable of all coastal environments Pressure from developers for residential industrial and recreational development has caused most of our barriers to become significantly impacted by human activity especially over the past few decades These pressures have led to extensive preservation of

natural barriers through efforts from all levels of government and also by private organizations Governments have also formed coastal management programs that help to control any future development with the intent being to keep human activity compatible with barrier island morphodynamics In order to devise appropriate coastal zone management programs it is necessary to have a comprehensive understanding of the morphodynamics of barrier island systems This volume provides comprehensive details on barrier island morphology sediment distribution and the process response mechanisms that cause changes to both These are the important aspects of barrier systems that can provide important input into the development and implementation of coastal management programs
