Autonomous Search Youssef Hamadi,Eric Monfroy,Frédéric Saubion,2012-01-05 Decades of innovations in combinatorial problem solving have produced better and more complex algorithms These new methods are better since they can solve larger problems and address new application domains They are also more complex which means that they are hard to reproduce and often harder to fine tune to the peculiarities of a given problem This last point has created a paradox where efficient tools are out of reach of practitioners Autonomous search AS represents a new research field defined to precisely address the above challenge Its major strength and originality consist in the fact that problem solvers can now perform self improvement operations based on analysis of the performances of the solving process including short term reactive reconfiguration and long term improvement through self analysis of the performance offline tuning and online control and adaptive control and supervised control Autonomous search crosses the chasm and provides engineers and practitioners with systems that are able to autonomously self tune their performance while effectively solving problems This is the first book dedicated to this topic and it can be used as a reference for researchers engineers and postgraduates in the areas of constraint programming machine learning evolutionary computing and feedback control theory After the editors introduction
