Simulating Ecological and Evolutionary Systems in C Will Wilson, 2000-06-22 An excellent resource for those seeking to adopt a computational approach to the analysis of complex natural biological systems *Fundamentals of Ecological Modelling* S.E. Jorgensen, G. Bendoricchio, 2001-08-14 This is a thoroughly revised and updated edition of an authoritative introduction to ecological modelling Sven Erik Jorgensen Editor in Chief of the journal Ecological Modelling and Giuseppe Bendoricchio Professor of Environmental Modelling at the University of Padova Italy offer compelling insights into the subject This volume explains the concepts and processes involved in ecological modelling presents the latest developments in the field and provides readers with the tools to construct their own models The Third Edition features A detailed discussion and step by step outline of the modelling procedure An account of different model types including overview tables examples and illustrations A comprehensive presentation of the submodels and unit processes used in modelling In depth descriptions of the latest modelling techniques Structured exercises at the end of each chapter Three mathematical appendices and a subject index This practical and proven book very effectively combines the theory methodology and applications of ecological modelling The new edition is an essential up to date guide to a rapidly growing field **Individual-based Modeling and Ecology** Volker Grimm, Steven F. Railsback, 2013-11-28 Individual based models are an exciting and widely used new tool for ecology These computational models allow scientists to explore the mechanisms through which population and ecosystem ecology arises from how individuals interact with each other and their environment This book provides the first in depth treatment of individual based modeling and its use to develop theoretical understanding of how ecological systems work an approach the authors call individual based ecology Grimm and Railsback start with a general primer on modeling how to design models that are as simple as possible while still allowing specific problems to be solved and how to move efficiently through a cycle of pattern oriented model design implementation and analysis Next they address the problems of theory and conceptual framework for individual based ecology What is theory That is how do we develop reusable models of how system dynamics arise from characteristics of individuals What conceptual framework do we use when the classical differential equation framework no longer applies An extensive review illustrates the ecological problems that have been addressed with individual based models The authors then identify how the mechanics of building and using individual based models differ from those of traditional science and provide guidance on formulating programming and analyzing models This book will be helpful to ecologists interested in modeling and to other scientists interested in agent based modeling *Fundamentals of Ecological Modelling* Sven Erik Jorgensen, G. Bendoricchio, 2001 Cover Contents Preface Acknowledgements Chapter 1 Introduction 1 1 Physical and Mathematical Models 1 2 Models as a Management Tool 1 3 Models as a Scientific Tool 1 4 Models and Holism 1 5 The Ecosystem as an Object for Research 1 6 Outline of the Book 1 7 The Development of Ecological and Environmental Models 1 8 State of the Art in the Application of Models Chapter 2 Concepts of Modelling 2 1 Introduction

Software Tools and Algorithms for Biological Systems is composed of a collection of papers received in response to an announcement that was widely distributed to academicians and practitioners in the broad area of computational biology and software tools Also selected authors of accepted papers of BIOCOMP 09 proceedings International Conference on Bioinformatics and Computational Biology July 13 16 2009 Las Vegas Nevada USA were invited to submit the extended versions of their papers for evaluation *From Animals to Animats 9* Stefano Nolfi, 2006-09-20 This book constitutes the refereed proceedings of the 9th International Conference on Simulation of Adaptive Behavior SAB 2006 The 35 revised full

papers and 35 revised poster papers presented are organized in topical sections on the animat approach to adaptive behaviour perception and motor control action selection and behavioral sequences navigation and internal world models learning and adaptation evolution collective and social behaviours applied adaptive behavior and more *Environmental Modeling* Mike J. Barnsley, 2007-02-13 Increasingly used to represent climatic biogeochemical and ecological systems

computer modeling has become an important tool that should be in every environmental professional's toolbox *Environmental Modeling A Practical Introduction* is just what it purports to be a practical introduction to the various methods techniques and skills required for computerized environmental modeling Exploring the broad arena of environmental modeling the book demonstrates how to represent an environmental problem in conceptual terms formalize the conceptual model using mathematical expressions convert the mathematical model into a program that can be run on a desktop or laptop computer and examine the results produced by the computational model Equally important the book imparts skills that allow you to develop implement and experiment with a range of computerized environmental models The emphasis is on active engagement in the modeling process rather than on passive learning about a suite of well established models The author takes a practical approach throughout one that does not get bogged down in the details of the underlying mathematics and that encourages learning through hands on experimentation He provides a set of software tools and data sets that you can use to work through the various examples and exercises presented in each chapter as well as presentational material and handouts for course tutors Comprehensive and up to date the book discusses how computational models can be used to represent environmental systems and illustrates how such models improve understanding of the ways in which environmental systems function *Constructed Climates* Will Wilson, 2011-02-28 This study demonstrates the value of urban green Focusing specifically on the role of vegetation and trees the book shows the costs and benefits reaped from urban open

spaces from cooler temperatures to better quality ground water and why it all matters While a work of science the book does not ignore the social component it looks at low income areas that have poor vegetation and shows how enhancing these areas through the planting of community gardens and trees can alleviate social ills

Animal Communication Networks P. K. McGregor, 2005-03-31 Most animal communication has evolved and now takes place in the context of a communication network i e several signallers and receivers within communication range of each other This idea follows naturally from the observation that many signals travel further than the average spacing between animals This is self evidently true for long range signals but at a high density the same is true for short range signals e g begging calls of nestling birds This book provides a current summary of research on communication networks and appraises future prospects It combines information from studies of several taxonomic groups insects to people via fiddler crabs fish frogs birds and mammals and several signalling modalities visual acoustic and chemical signals It also specifically addresses the many areas of interface between communication networks and other disciplines from the evolution of human charitable behaviour to the psychophysics of signal perception via social behaviour physiology and mathematical models

Systems Analysis and Simulation in Ecology Bernard C. Patten, 2013-09-11 *Systems Analysis and Simulation in Ecology* Volume I is a book of ecology in transition from a soft science synecology to a hard science systems ecology It is an enthusiastic and optimistic statement about the fundamental adaptability of the scientific mechanism to newly appreciated truths of existence It documents in ecological science a move away from the explanatory or cognitive criterion toward the predictive criterion a hard one with the potential of leading ultimately to optimal design and control of ecosystems The book is organized into three parts Part I is an overview of some of the methods and rationales for ecological systems modeling for the purposes of simulation and systems analysis It provides an elementary introduction to the use of analog and digital computers for simulation and a rationale for ecological model building Part II illustrates three different approaches to population modeling These include a mathematical analysis of microbial *Chlorella Selenastrum* dynamics in both continuous and batch cultures and a bioenergetics study of the terrestrial isopod *Armadillidium* utilizing concepts from control theory and the transfer function technique of classical dynamic analysis Part III brings together a group of papers describing various aspects and philosophies of ecological simulation These include common problems in ecosystem simulation and the question whether or not some of the newer methods of systems ecology might not be used in connection with some of the older data and observations of traditional synecology
