MODEL BUILDING IN MATHEMATICAL PROGRAMMING
R.F. Williams, *Edinburgh University*

This book first discusses the general principles of model building in mathematical programming then presents 20 practical problems to which mathematical programming can be applied. These problems have been classified to avoid the tedious mechanical detail inherent in most case studies but the essence of the problems has been preserved and should be fully understood. Finally, suggested treatments and solutions to the problems are given in the last part of the book.

It emphasises the modelling as opposed to the algorithmic side of mathematical programming. The use of linear programming is covered and the transportation of the solution of a model (e.g. optimal costs, shadow prices, etc.) is given comprehensive treatment. Sensitivity analysis is discussed in detail.

METHODS OF OPTIMIZATION
C.R. Woot, *University of York*

This book is concerned with the theory and practice of modern methods of minimizing or maximizing a function of many variables, with or without constraints. It shows how these methods have developed from classical calculus, on the one hand, and the most recent mathematical programming techniques, on the other. This is an introductory text on optimization with many exercises for the reader and is aimed at third-year university undergraduates and first-year postgraduate students.

Parameter Setting in Evolutionary Algorithms F.J. Lobo, Cláudio F. Lima, Zbigniew Michalewicz, 2007-04-03 One of the main difficulties of applying an evolutionary algorithm or as a matter of fact any heuristic method to a given problem is to decide on an appropriate set of parameter values Typically these are specified before the algorithm is run and include population size selection rate operator probabilities not to mention the representation and the operators themselves This book gives the reader a solid perspective on the different approaches that have been proposed to automate control of these parameters as well as understanding their interactions The book covers a broad area of evolutionary computation including genetic algorithms evolution strategies genetic programming estimation of distribution algorithms and also discusses the

issues of specific parameters used in parallel implementations multi objective evolutionary algorithms and practical consideration for real world applications It is a recommended read for researchers and practitioners of evolutionary computation and heuristic methods
