Peatland Forestry Ecology And Principles Ecological Studies Vol 111:

Peatland Forestry Eero Paavilainen, Juhani Päivänen, 2013-03-09 The book provides a review and synthesis of boreal mire ecosystems including peat soil properties mire hydrology carbon and nutrient cycling and classification of mire sites The emphasis however is on peatland forests as a renewable natural resource The approach originated in northern Europe because there especially in Finland operational scale forest drainage has a long tradition based on research aiming to maintain and increase wood production on peatlands Whenever relevant a closer look is also given to other countries in Europe Canada and the USA The results of recent studies on different environmental effects of peatland forestry are also discussed in detail

Tropical Peatland Ecosystems Mitsuru Osaki, Nobuyuki Tsuji, 2015-12-07 This book is an excellent resource for scientists political decision makers and students interested in the impact of peatlands on climate change and ecosystem function containing a plethora of recent research results such as monitoring sensing modeling for carbon water flux storage biodiversity and peatland management in tropical regions It is estimated that more than 23 million hectares 62 % of the total global tropical peatland area are located in Southeast Asia in lowland or coastal areas of East Sumatra Kalimantan West Papua Papua New Guinea Brunei Peninsular Malaysia Sabah Sarawak and Southeast Thailand Tropical peatland has a vital carbon water storage function and is host to a huge diversity of plant and animal species Peatland ecosystems are extremely vulnerable to climate change and the impacts of human activities such as logging drainage and conversion to agricultural land In Southeast Asia severe episodic droughts associated with the El Niño Southern Oscillation in combination with over drainage forest degradation and land use changes have caused widespread peatland fires and microbial peat oxidation Indonesia's 20 Mha peatland area is estimated to include about 45 55 GtC of carbon stocks As a result of land use and development Indonesia is the third largest emitter of greenhouse gases 2 3 Gtons carbon dioxide equivalent per year 80 % of which is due to deforestation and peatland loss Thus tropical peatlands are key ecosystems in terms of the carbon water cycle and climate change

Ecology and Evolution of the Freshwater Mussels Unionoida G. Bauer, 2001 All those who think that bivalves are boring are in the best company Karl von Frisch is reported to have turned the pages more quickly in texts where bivalves were treated because according to him they literally lack any behaviour The fact that they can filtrate huge amounts of water burrow into the sediment actively swim drill holes into rocks and boats or detect shadows with the aid of pretty blue eyes located on the rim of their mantle obviously left von Frisch unimpressed Why then a book on the large freshwater mussels Naiads or Unionoida which on first sight are much less spectacular than the marine ones The main reason is that they are keepers of secrets which they reveal only on close and careful inspection This is not only true for the pearls some species produce and which over centuries have contributed to the treasures of bishops and kings but particularly for their ecology their life cycles are linked with those of fishes some can occur in incredible densities and some can live for more than 100 years Thus the presence or absence of naiads in a lake or stream has manifold

implications *Humic Substances, Peats and Sludges* M H B Hayes, W S Wilson, 1997-01-01 Based on the contributions given at a leading international conference this volume concentrates on developments in the environmentally friendly disposal of sludges and on the reawakened interest in composting which has emerged as a result of significant European directives **The Wetlands Handbook, 2 Volume Set** Edward Maltby, Tom Barker, 2009-07-23 Forty two chapters by

international experts from a wide range of disciplines make The Wetlands Handbook the essential tool for those seeking comprehensive understanding of the subject A departure from more traditional treatises this text examines freshwater wetland ecosystem science from the fundamentals to issues of management and policy Introductory chapters address the scope and significance of wetlands globally for communities culture and biodiversity Subsequent sections deal with processes underpinning wetland functioning how wetlands work their uses and values for humans and nature their sensitivity to external impacts and how they may be restored The text is illustrated by numerous examples emphasising functional and holistic approaches to wetland management including case studies on the wise use and rehabilitation of wetlands in farmed urban industrial and other damaged environments highlighting the long term benefits of multiple use The Wetlands Handbook will provide an invaluable reference for researchers managers policy makers and students of wetland sciences **Forest**

Management and the Water Cycle Michael Bredemeier, Shabtai Cohen, Douglas L. Godbold, Elve Lode, Viliam Pichler, Patrick Schleppei, 2010-10-25 The protective function of forests for water quality and water related hazards as well as adequate water supplies for forest ecosystems in Europe are potentially at risk due to changing climate and changing land management practices Water budgets of forest ecosystems are heavily dependent on climate and forest structure The latter is determined by the management measures applied in the forestry sector Various developments of forest management strategies imposed on a background of changing climate are considered in assessing the overall future of forest water interactions in Europe Synthesizing recent research on the interactions of forest management and the water regime of forests in Europe and beyond the book makes an important contribution to the ongoing dialogue between scientists dealing with different scales of forest water interactions This collaborative endeavour which covers geographic and climatic gradients from Iceland to Israel and from southern Spain to Estonia and Finland was made possible through the COST Action Forest Management and the Water Cycle FORMAN which was launched in 2007 <http://www.forestandwater.eu> The book will be of particular interest to the research community involved in forest ecosystem research and forest hydrology as well as landscape ecologists and hydrologists in general It will also provide reference material for forest practitioners and planners in hydrology and land use *Ecology of Mediterranean Evergreen Oak Forests* Ferran Roda, Javier Retana, Carlos A.

Gracia, Juan Bellot, 2012-12-06 Used by humans since ancient times evergreen oak forests still cover extensive mountain areas of the Mediterranean Basin These broadleaved evergreen forests occupy a transitional zone between the cool temperate deciduous forest biome and the drier Mediterranean pine forests and shrublands Slow growing and casting a deep

shade the sclerophyllous holm oak *Quercus ilex* absolutely dominates the closed canopy of many Mediterranean evergreen oak forests This is a synthesis of 20 years of research on the structure function and dynamics of holm oak forests in two intensively studied experimental areas in Spain By combining observational measurements at the leaf tree plot and catchment scales with field experiments and modelling the authors explore how these forests cope with strong water limitation and repeated disturbances

Biodiversity and Savanna Ecosystem Processes Otto T. Solbrig, Ernesto Medina, Juan F. Silva, 2013-03-07 Savannas are the most widespread ecosystem in the tropics and as such are subjected to great human pressure that may result in massive soil degradation The book addresses the role of species in the function of savanna ecosystems It is shown that savannas are enormously diverse and that four factors determine the function of savanna ecosystems Plant Available Moisture Plant Available Nutrients Fire Herbivores

Banded Vegetation Patterning in Arid and Semiarid Environments David J. Tongway, Christian Valentin, Josiane Seghieri, 2001-06-15 Aerial photography has revealed the striking widespread phenomenon of repeating patterns of vegetation in more arid areas of the world Two interdependent phases bands of dense and sparse vegetation alternate in the landscape This volume synthesizes half a century's accumulated knowledge of both theoretical and applied landscape function from a variety of these regions It covers structure dynamics and methods of study as well as disturbances to these landscapes and relevant management issues Various chapters discuss the role of modeling in answering questions about the origins and complex processes of banded landscapes

Vertical Food Web Interactions Konrad Dettner, Gerhard Bauer, Wolfgang Völkl, 2012-12-06 In the past years much work has been carried out on either life history evolution or structure and function of food webs However most studies dealt with only one of these areas and often touched upon the other only marginally In this volume we try to synthesize aspects of both disciplines and will concentrate on how the interactions between organisms depend on their life history strategies Since this is a very comprehensive topic this volume will focus on vertical interactions to remain within a clearly arranged field We present some scenarios based on life history variation of resource and consumer and show how particular patterns of life history combinations will lead to particular patterns in trophic relationships We want to deal with the selective forces underlying these patterns the degree of specificity of the consumers determines the dependence on its resource and its adaptation to the spatial and temporal availability of the resource In this respect the spatial structure of the resource and its quality may play an important role The impact of natural enemies is another important selective force which may influence the evolution of interactions between species and the structure of communities Here the acquirement of an enemy free space may provide selective advantages The importance of the impact of enemies is also expressed by the development of numerous and sometimes very subtle defense strategies This will be demonstrated especially for various aspects of chemical ecology

Predation in Vertebrate Communities Bogumila Jedrzejewska, Włodzimierz Jedrzejewski, 2013-11-11 Predation one of the most dramatic interactions in animals' lives has long fascinated ecologists This

volume presents carnivores raptors and their prey in the complicated net of interrelationships and shows them against the background of their biotic and abiotic settings It is based on long term research conducted in the best preserved woodland of Europe s temperate zone The role of predation whether limiting or regulating prey ungulate rodent shrew bird and amphibian populations is quantified and compared to parts played by other factors climate food resources for prey and availability of other potential resources for predators

Ecosystem Approaches to Landscape Management in Central Europe J.D. Tenhunen,R. Lenz,Ralph Hantschel,2001-01-25 The challenges in ecosystem science encompass a broadening and strengthening of interdisciplinary ties the transfer of knowledge of the ecosystem across scales and the inclusion of anthropogenic impacts and human behavior into ecosystem landscape and regional models The volume addresses these points within the context of studies in major ecosystem types viewed as the building blocks of central European landscapes The research is evaluated to increase the understanding of the processes in order to unite ecosystem science with resource management The comparison embraces coastal lowland forests associated wetlands and lakes agricultural land use and montane and alpine forests Techniques for upscaling focus on process modelling at stand and landscape scales and the use of remote sensing for landscape level model parameterization and testing The case studies demonstrate ways for ecosystem scientists managers and social scientists to cooperate

Urban Air Pollution and Forests Mark E. Fenn,L.I. de Bauer,Tomas Hernandez-Tejeda,2012-12-06 At present roughly half of the world s population lives in urban centers There are now more than 20 cities with a population of over 10 million inhabitants compared to less than 5 about 50 years ago This tendency toward urbanization is expected to continue particularly in the developing world A consequence of this growing trend is that millions of people are being exposed to harmful levels of urban air pollutants caused mainly by emissions from motor vehicles and from industrial and domestic activities involving the combustion of fossil fuels The driving force for the design and implementation of emission control strategies aimed at improving air quality has been the protection of the health of the population in urban centers There are however other consequences of the presence of air pollutants besides the direct effect on human health Reduced visibility damage to monuments and buildings and many other such consequences indirectly affect our quality of life Another set of consequences involves damage to ecological systems In fact the nature of photochemical smog was first uncovered in the 1950s in connection with observations of its harmful effects on crops and plants in the vicinity of Los Angeles

Global Biodiversity in a Changing Environment F.Stuart Chapin,Osvaldo E. Sala,Elisabeth Huber-Sannwald,2013-12-01 The scientific community has voiced two general concerns about the future of the earth Climatologists and oceanographers have focused on the changes in our physical environment changes in the climate the oceans and the chemistry of the air we breathe Environmental biologists on the other hand have addressed issues of conservation and the extinction of species There is increasing evidence that these two broad concerns are intertwined and mutually dependent Past changes in biodiversity have both responded to and caused changes in Earth s environment In its

discussions of ten key terrestrial biomes and freshwater ecosystems this volume uses our broad understanding of global environmental change to present the first comprehensive scenarios of biodiversity for the twenty first century Combining physical earth science with conservation biology Future Scenarios of Global Biodiversity provides a starting point for regional assessments on all scales The book will be of interest to those concerned with guiding research on the changing environment of the earth and with planning future policy especially in accordance with the Global Biodiversity Convention Marine

Benthic Vegetation Winfried Schramm,1996-07-04 This book investigates the impact of eutrophication on marine benthic macrophytes in eight different locations along the Baltic North Sea Atlantic and Mediterranean coasts **Rainforest**

Ecosystems of East Kalimantan Edi Guhardja,2000 Since the late 1960s the Indonesian state of East Kalimantan has witnessed a marked increase in the impact of human activities chiefly commercial logging and agricultural exploitation Located on the island of Borneo East Kalimantan also was subjected to prolonged droughts and extensive wildfires in 1982 83 and 1997 98 that were linked to the El Nino Southern Oscillation ENSO phenomenon The changes in the rainforest ecosystem in East Kalimantan during this 15 year cycle of severe ENSO events are the subject of this book With an eye toward development of rehabilitation techniques for sustainable forest management the authors examine possible interactive effects of drought fire and human impacts on the flora and fauna of the area **Pelagic Nutrient Cycles** Tom

Andersen,2013-06-29 While ecology is one of the scientific disciplines that most clearly belongs to basic research it also strives to serve as a predictive tool for management Outstanding examples of predictive ecology are Vollenweider's models on the relationship between phosphorus load and water renewal time of lakes and the resulting algal biomass The needed few and easily accessible input parameters to very simple models provided a direct link from basic ecology to management and today these models are key tools for managers worldwide to control lake eutrophication and algal blooms The baseline of this success is the general relation between phosphorus concentration and phytoplankton biomass that is observed for most lakes While these relationships are most frequently presented in log log diagrams the aquatic ecologist who replots these a linear scale may ask himself why in spite of the overall correlation there is still such a variability It is possible to predict levels of algal biomass that may be synthesized at a given phosphorus load Some lakes apparently offer optimal conditions for their phytoplankton communities while others may support less than half the biomass at the same phosphorus load There are limits to growth however and the predictive outcome of phosphorus load decreases as the load increases This holds in particular for the higher trophic levels like zooplankton and fish With increased enrichment there are signs of decreased efficiency of energy transfer between foodweb compartments *Fire, Climate Change, and Carbon Cycling in the Boreal Forest* Eric S. Kasischke,Brian J. Stocks,2012-08-22 In boreal forests which contain large amounts of the world's terrestrial organic carbon fire is a natural and fundamental disturbance regime essential in controlling many ecosystem processes As a result of predicted climate change in the future the fire regime and consequently the forest cover and carbon storage of

boreal regions will undergo dramatic alterations This volume discusses the direct and indirect mechanisms by which fire and climate interact to influence carbon cycling in North American boreal forests The first section summarizes the information needed to understand and manage fire s effects on the ecology of boreal forests and its influence on global climate change issues Following chapters discuss in detail the role of fire in the ecology of boreal forests Subsequent sections present data sets on fire and the distribution of carbon discuss the use of satellite imagery in monitoring these regions and discuss approaches to modeling the relevant processes The book offers the following new results improved estimates of carbon released during fires at a variety of scales from individual sites to the entire North American boreal forest region direct evidence of enhanced soil respiration after fire in Alaskan boreal forests studies of the influence of fire on long term forest succession patterns modeling results of the effects of climate warming on the fire regime examples of the use of satellite imagery to monitor surface characteristics important in carbon cycling modeling results of how climate change will interact with the fire regime to influence carbon storage Canadian Journal of Forest Research ,2016-10 Coral Reef Ecology Yuri I. Sorokin,2013-03-12 Coral reef communities are among the most complex mature and productive ecosystems on earth Their activity resulted in the creation of vast lime constructions Being extremely productive and having the function of a powerful biofilter coral reefs play an important role in global biogeochemical processes and in the reproduction of food resources in tropical marine regions All aspects of coral reef science are covered systematically and on the basis of a holistic ecosystem approach The geological history of coral reefs their geomorphology as well as biology including community structure of reef biota their functional characteristics physiological aspects biogeochemical metabolism energy balance environmental problems and management of resources are treated in detail
