

La tectonique des plaques

Il s'agit d'une théorie qui explique que les 7 grandes plaques et plusieurs petites tectoniques se déplacent les unes par rapport aux autres, sous l'effet des mouvements de convection du manteau.

Certaines zones plaques s'écartent, on parle (de 1968) de rift, par rapport au magma venant. C'est aussi que les autres prennent naissance ou

Les particularités du rift

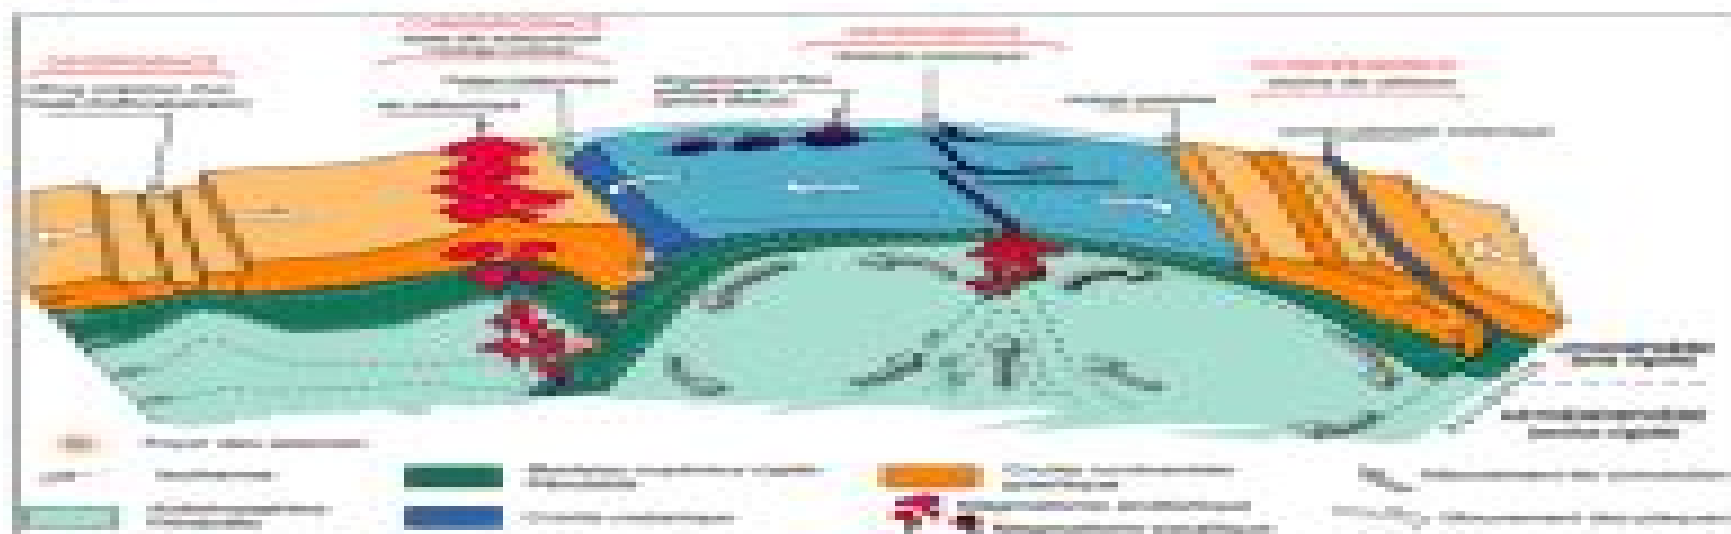

La formation d'une dorsale océanique est une tectonique. Elle se caractérise par la divergence des plaques et la remontée du magma.

submergent. On parle alors de suture océanique.

L'écartement des plaques tectoniques est compensé par une disparition de matière ailleurs, soit par subduction des plaques sous d'autres, quand la plaque océanique plonge sous une plaque continentale ou sous une autre océanique, ou par fusion de matière dans le magma.

Quand la dorsale se crée sous une plaque d'effondrement au centre des masses continentales, le processus est différent, et peut être dénommé « zone de collision ». Sur leurs marges, les deux plaques se frottent, se cassent, et se soulèvent, pouvant les rendre vers le haut : cela explique la création des chaînes de montagnes.
