SKYLAB MANNED ORBITAL SCIENTIFIC SPACE STATION

Skylab is the name of an experimental space station program of the National Aeronautics and Space Administration (NASA). An extension of the manned Mercury-Gemini-Apollo space programs, the Skylab Program will make extensive use of the hardware and technological base developed during those previous missions.

The Skylab Program is designed to expand our knowledge of manned earth-orbital operations and to accomplish carefully selected scientific, technological, and medical investigations.

The success of the Skylab Program is essential not only in achieving sound decisions on the content and configuration of future space vehicles, but in gaining the confidence and support needed for later, more advanced programs.

Three groups of experiments are of particular importance: an Earth Resources Experiment Package designed for investigating and application of remote sensing of the earth resources, a series of medical experiments associated with the careful extension of man's living and working in space for longer periods of time, and several high-resolution astronomical experiments for studying the sun at short wavelengths not observable from the earth.

The Skylab Program, scheduled to begin late in 1972, will consist of several low earth-orbital missions — approximately 235 nautical miles altitude —

using the payload of the Saturn V and Saturn IB launch vehicles. The series of missions will begin with the orbital insertion of an unmanned Saturn workshop (SWS). Each subsequent launch will provide a manned command and service module (CSM) that will rendezvous and dock with the SWS. Because of the unique design, which incorporates the huge third stage of the Saturn V launch vehicle and provides an orbital facility equal in volume to a medium-sized home, the program is expected to provide the United States with the capability to develop and maintain permanent space stations that will be of increasing benefit to mankind.

The goal of the Skylab Program is the accomplishment of four basic objectives.

1. Scientific investigations in earth orbit. — These investigations are designed to take advantage of space operations to learn more about the universe, the space environment, the phenomena that exist in the solar system, and the manner in which these phenomena influence our earth environment.

2. Applications in earth orbit. — Applications experiments include the development and evaluation of efficient techniques using man for sensor operation, discrimination, data selection and evaluation, control, maintenance and repair, assembly and setup, and mobility. These experiments include studies in meteorology, earth resources, and communications. The
