Sumioka,1985 Relationship of Climate Change to Seawater Intrusion in Coastal Aquifers William Logan Dyer,2014 Scientific consensus has established that climate change over the next century will cause a significant rise in global mean sea level a confluence of factors places this rise to be between 0.25 meters and 0.95 Meters with a 95% confidence interval Along with compounding issues like changes in the precipitation cycle this rise in sea level will impact groundwater resources particularly in sensitive areas such as coastal aquifers As a reasonable understanding of the dynamics of aquifer systems has been developed the actual impact on these groundwater resources can be estimated moreover they should be estimated in order to help prepare robust water management strategies for coastal communities a preliminary investigation is conducted within this work for the case study of the Californian Oxnard Mugu Aquifer employing the hydrostatic balance relationships established by Ghyben and Herzberg and by Glover in their now standard works on groundwater hydrology Numerical Simulation of Saltwater Intrusion in Coastal Aquifers Boutaina Bouzouf,2015 The modeling of groundwater in coastal aquifers is an important and difficult issue in water resources The primary difficulty resides in efficient and accurate simulation of the movement of the saltwater front This thesis is devoted to the sharp interface numerical study of one and two dimensional of seawater intrusion into coastal aquifers The Finite Volume method is adopted here to solve the set of simultaneous diffusion differential equations describing the motion of saltwater and freshwater separated by a sharp interface These diffusion equations are based on the Dupuit approximation and are obtained from integration over the vertical dimension The one dimensional Finite Volume model is first being validated using academic test case studies with known close form solutions The second purpose of this study is to compare two dimensional numerical methods Finite Volume method and Sharp model based on Finite Difference method when applied to a Llobregat aquifer in Barcelona Spain Both methods are using the same

mathematical formulation for the sharp interface The comparison between both methods indicates that Finite Volume method provides predictions closer to the observed results

ANALYSIS OF SALTWATER INTRUSION AND INVESTIGATIONS ON PREVENTION TECHNIQUES IN COASTAL AQUIFERS. ,2001

In this study the saltwater intrusion in coastal aquifers is briefly described and the prevention techniques are discussed By using two computer models SWI and SHARP the movement of freshwater and saltwater is analyzed on hypothetical cases and on one real aquifer in Marmaris in the coast of Mediterranean Region Artificial recharge and subsurface barrier techniques are applied to hypothetical cases as means of controlling the saltwater intrusion The performance of strip recharge and subsurface barrier in reducing the salt water intrusion is analyzed by simulation of the groundwater flow with the codes mentioned above The results obtained are compared with each other The results of hypothetical cases are relatively in good agreement For the real aquifer the results show discrepancy that cannot be ignored
