Accelerating Pediatric Magnetic Resonance Imaging Using Deep Learning-based Image Reconstruction

Christopher Michael Sandino, 2021 Magnetic resonance imaging MRI is a powerful diagnostic tool for visualizing soft tissue anatomy but physical limits on data acquisition speed result in uncomfortably long MRI exams This is problematic for many patient populations but especially for pediatric patients who often require general anesthesia GA to reduce anxiety and body motion Many attempts at accelerating data acquisition have been made to reduce or eliminate use of GA for pediatric MRI For example compressed sensing CS methods have been used to iteratively reconstruct rapidly acquired measurements into high quality images by leveraging sparse priors More recently deep learning DL methods have been used to train deep neural network models to map the rapidly acquired measurements into even higher quality images While DL reconstruction approaches may potentially accelerate data acquisition beyond CS these approaches have several issues which impede their clinical adoption First DL reconstructions require large quantities of high quality ground truth data for supervised training which can be costly and time consuming to acquire Second memory requirements during network training limit the applicability of DL reconstruction to low dimensional MRI data such as static or dynamic 2 D imaging with limited spatiotemporal resolution In this thesis a series of projects demonstrating robust DL reconstruction techniques for acceleration of high dimensional pediatric MRI will be presented First physics based models are incorporated into deep CNN architectures to enforce consistency between intermediate network outputs and the rapidly acquired measurements in a novel method called DL ESPIRiT Physics based modeling allows DL ESPIRiT to be trained end to end in a supervised fashion with relatively little training data compared to non physics driven DL reconstruction DL ESPIRiT is applied and validated on 12X prospectively accelerated dynamic 2 D MRI scans acquired at Lucile Packard Children s Hospital Finally DL ESPIRiT is extended to leverage subspace methods within the network to address GPU memory limitations during training This method known as deep learning based subspace reconstruction DL Subspace reconstructs a compressed representation of the MRI data instead of the data directly thereby reducing the memory footprint during training and accelerating DL inference times DL Subspace is demonstrated to reconstruct 2 D dynamic MRI data with 4X higher memory efficiency and inference speed

Pediatric Gastrointestinal Imaging and Intervention David A. Stringer, Paul S. Babyn, 2000

Here is the most comprehensive and authoritative work on radiologic diagnosis of pediatric gastrointestinal disorders Packed with hundreds of outstanding clinical images **Pediatric Gastrointestinal Imaging and Intervention** offers explicit step by step instructions for performing and interpreting the latest diagnostic techniques It discusses the imaging methods practitioners are likely to employ including sonography plain film and contrast radiography endoscopy CT MRI nuclear medicine angiography and interventional radiology **Open Field Magnetic Resonance Imaging** D.H.W. Grönemeyer,R.B.

Lufkin,2012-12-06 Until the advent of the Access open magnet introduced by Diasonics in 1988 claustrophobia and the loud hammering noise were considered part of the price patients had to pay for the benefits of this superb imaging approach The fact that it was possible to obtain images of acceptable diagnostic quality while the patient was resting comfortably in pleasant airy surroundings reminiscent of a four poster bed was certainly a great advantage It became obvious however that the open magnet also offered the opportunity for the interventional radiologist or surgeon to perform procedures as access to the patient was immediate and can be continuous during the scanning It was also necessary to develop methods for real time imaging and also vary the spatial resolution obtaining the best when speed was not essential After this instrument showed the potential of revolutionizing both the approach to imaging as well as interventional radiology by eliminating the exposure to ionizing radiation allowing more complicated interventions to be image guided several other companies embraced the idea of open magnets These instruments have started to proliferate and now occupy a significant portion of the market
