

HOW LIFE BEGINS

SECTION 2: CELL DIVISION AND REPRODUCTION

2.1 CELL DIVISION

1. **Cell division:** the process of dividing of a cell (parent cell) into 2 or more cells (daughter cells)

Cell division = Nuclear Division + Cytokinesis (division of cytoplasm)

Cell Division	Nuclear Division
Mitotic Cell Division	Mitosis
Meiotic Cell Division	Meiosis

2. Chromatin

It consists of DNA and proteins.

Before cell division, the DNA is spreading in the nucleus and does not appear to have any structure under microscope.

DNA coils many times around some proteins to form a chromosome.

3. Chromosome

The characteristics of organisms are determined by the genetic materials inside their cells. Genetic information is carried by DNA which are present in the nucleus of a cell.

DNA is a molecule consists of 2 chains twisted around each other forming a double helix. When the cell is going to have cell division, the DNA is duplicated (doubled).

The DNA is coiled around protein molecules (histone) for many times until it is condensed to form rod-like structure known as chromosome.

As the DNA is duplicated, the 2 DNA molecules are still attached together at the centromere in the chromosome.

The chromosome has 2 chromatids. The 2 chromatids are identical and known as sister chromatids. They will be separated into daughter cells during cell division.
