Beard, Frank

Sharp, 2012-12-06 The first few months of any pregnancy are of supreme importance to the success of that pregnancy This statement is so obvious as to be almost a platitude yet it must be said that no aspect of pregnancy has been more neglected in the human than the first three months Little is known of the morphological changes that occur at that time and our knowledge of the mechanisms that control this vital stage of pregnancy is almost non existent The explanation for this neglect of what is an obvious area for study is the difficulty of obtaining normal material It is rare to have material to study from a healthy first trimester pregnancy and the study by Hertig and Rock I of early conception found by chance in hysterectomy speci mens must be unique The information that we do have about early pregnancy is mostly gained from animal studies or single miscarriages in humans Chromosomal defects are common but are not an explanation for the majority of recurrent miscarriages Obstetricians have hypothesised many causes for this condition and have developed numerous methods for treating it but the studies have been poorly controlled so that our understanding of the causes has not advanced Treatment of women with a history of recurrent miscarriage by paternal leukocyte infusion immunotherapy may be yet another form of treatment that is hailed as a new advance only to be rejected when subject to rigorous testing

Perspectives, 1993 **Future Aspects in Contraception** B. Runnebaum, T. Rabe, L. Kiesel, 2012-12-06 Atrophy of gonadotrophin-producing cells. Exogenously LH synthesis administered androgens and release of anabolic steroids are decreased. Prostate Testes Normal function. Testosterone synthesis in the deficit of endogenously Leydig cells is decreased. The synthesized testosterone is exogenously administered, compensated for by the steroid, is not able to exogenously administered compensate for the deficit of steroid endogenously synthesized testosterone. Figure 2 Intratesticular and serum testosterone concentrations after treatment with androgens or anabolic steroids in order to substitute for the peripheral androgen deficiency and to achieve azoospermia. Because this steroid is alkylated in position 17, toxic effects on liver function can not be excluded. Danazol offers no advantages as compared with other anabolic steroids rather disadvantages. Numerous experiments of this type have been performed during the last 40 or 50 years. The outcome in each case was more or less identical with a certain dose of an androgen or anabolic steroid. It is possible to inhibit spermatogenesis without interfering with other androgen-dependent functions including libido, potentia coeundi, and accessory sexual glands. On the basis of this pharmacological endocrinological background, androgens and anabolic steroids can be used for male fertility control, and several clinical trials have been performed during the last 10-15 years. Some of these studies are mentioned in Table 2.
