New Perspectives in the Study of Mesoamerican Primates Alejandro Estrada, Paul A. Garber, Mary S. M. Pavelka, LeAndra Luecke, 2006-07-31 The purpose of this volume is to present a comprehensive overview of recent advances in primate field research ecology and conservation biology in Mesoamerica The overall goal of each contribution is to integrate newly collected field data with theoretical perspectives drawn from evolutionary biology socioecology biological anthropology and conservation to identify how our current knowledge of primate behavior and ecology has moved beyond more traditional approaches A corollary to this and an important goal of the volume is to identify geographical regions and species for which we continue to lack sufficient information to develop action plans for future research and to identify areas for immediate conservation action Despite many decades of primate research in Mesoamerica much is still unknown concerning the basic ecology and behavior of these species demography current distribution and conservation status of local populations and the effectiveness of conservation policies on primate survivorship Four major areas of research are the focus of the volume Evolutionary Biology and Biogeography Population Demography and Ecology Behavior and Conservation and Management Policies

Primate Reproductive Aging S. Atsalis, S. W. Margulis, P. R. Hof, Tamás Fülöp, 2008-06-16 Due to the unusually long post reproductive lifespan characteristic of human females primate reproductive aging receives a great deal of attention Promoting and supporting discussion on comparative analyses of aging among diverse primate species including humans this publication highlights current research on female primate reproductive aging from both institutional based as well as field studies The contributions highlight the complex interaction between somatic and reproductive senescence The latter is broadly manifested along a cross taxonomic evolutionary continuum with humans at one end of the spectrum exhibiting the lengthiest post reproductive lifespan Primatologists anthropologists evolutionary biologists animal behaviorists endocrinologists neuroscientists and all scholars interested in aging and reproduction will find this book a valuable source of information Considering the increasing number of geriatric primates held in captivity it will also be helpful to animal care professionals as it calls attention to the special care that primates may require in order to monitor maintain and improve their health as they age

Chiarelli,2013-03-13 The present volume is the result of a NATO Advanced Study Institute held in Montaldo Turin Italy between the 7 and 19 June 1972 The aim of the Study Institute has been the development of a general philosophy for the science of Primatology Lecturers were selected from those scientists deeply involved and interested in this field The course intended to serve students and researchers using primates in medical and biological research but especially those interested in the natural history of the group and in human biology In the past the study of primates was largely limited to determine the origin of the human species Today however interest in them extends far beyond this narrow focus In terms of both practical human purposes and theoretical interests the study of primate biology and behaviour is of ever increasing importance Their close comparative relationships with man has proved of such great value to human biology and medicine that their numbers and kinds are quickly dwindling For this reason one of the main focuses of the A S I was on their reproductive biology and conservation During the meeting days a broad series of lectures on specific topics of comparative anatomy physiology endocrinology reproductive physiology genetics and molecular biology cytogenetics and behaviour were delivered by leading primatologists      **Comprehensive Human Physiology** Rainer Greger,Uwe Windhorst,2013-11-11

Comprehensive Human Physiology is a significantly important publication on physiology presenting state of the art knowledge about both the molecular mechanisms and the integrative regulation of body functions This is the first time that such a broad range of perspectives on physiology have been combined to provide a unified overview of the field This groundbreaking two volume set reveals human physiology to be a highly dynamic science rooted in the ever continuing process of learning more about life Each chapter contains a wealth of original data clear illustrations and extensive references making this a valuable and easy to use reference This is the quintessential reference work in the fields of physiology and pathophysiology essential reading for researchers lecturers and advanced students      Follicular Growth

*Understanding Ageing* by Robin Holliday. Cambridge University Press. Reviewed by Anne Mitchell. *Hormones and Reproduction of Vertebrates* David O. Norris, Kristin H. Lopez, 2010-11-25. This series of volumes represents a comprehensive and integrated treatment of reproduction in vertebrates from fishes of all sorts through mammals. It is designed to provide a readable coordinated description of reproductive basics in each group of vertebrates as well as an introduction to the latest trends in reproductive research and our understanding of reproductive events. Whereas each chapter and each volume is intended to stand alone as a review of that topic or vertebrate group respectively, the volumes are prepared so as to provide a thorough topical treatment across the vertebrates. Terminology has been standardized across the volumes to reduce confusion where multiple names exist in the literature and a comprehensive glossary of these terms and their alternative names is provided. A complete essential and up-to-date reference for research scientists working on vertebrate hormones and reproduction and on animals as models in human reproductive research. Covers the endocrinology, neuroendocrinology, physiology, behaviour and anatomy of vertebrate reproduction. Structured coverage of the major themes for all five vertebrate groups allows a consistent treatment for all. Special chapters elaborate on features specific to individual vertebrate groups and to comparative aspects, similarities and differences between them. *The Evolution of Primate Societies* John C. Mitani, Josep Call, Peter M. Kappeler, Ryne A. Palombi, Joan B. Silk, 2012-10-24. In 1987 the University of Chicago Press published *Primate Societies*, the standard reference in the field of primate behavior for an entire generation of students and scientists. But in the twenty-five years since its publication, new theories and research techniques for studying the Primate order have been developed, debated and tested, forcing scientists to revise their understanding of our closest living relatives. Intended as a sequel to *Primate Societies*, *The Evolution of Primate Societies* compiles thirty-one chapters that review the current state of knowledge regarding the behavior of nonhuman primates. Chapters are written by the leading authorities in the field and organized around four major adaptive problems primates face as they strive to grow, maintain themselves and reproduce in the wild. The inclusion of chapters on the behavior of humans at the end of each major section represents one particularly novel aspect of the book and it will remind readers what we can learn about ourselves through research on nonhuman primates. The final section highlights some of the innovative and cutting-edge research designed to reveal the similarities and differences between nonhuman and human primate cognition. *The Evolution of Primate Societies* will be every bit the landmark publication its predecessor has been. **Man As the Prayer** Yup Lee, 2000. In this book a totally new picture of five million years of human evolutionary history is presented. Male and female hominids lived separately in different areas for most of the last five million years. They met together once a year and stayed together for a brief period.

What they did for and during this annual mating season is the key to the proper and correct understanding of human evolution Five million years ago the last common ancestors of the African great apes and humans lived in an extensive rain forest encompassing a river and a lake There was a system of mountains a lake and a river all of which were linked together Ever since then mountains rivers and lakes were intimately involved with humankind When the climate turned arid the riverside forest broke into fragments of small forests In desperate need of food the last common ancestors were forced to visit the trees which dotted the river shore They developed a unique mode of terrestrial locomotion to move between the main forest and the scattered patches of forest One day during drought a small group of apes ventured to a faraway tract of forest beside the river On the road they were caught in heavy rain and in the resulting frenzy they lost their way back home During their wanderings they evolved into gorillas Almost at the same time another small group of apes met the same fate and evolved into chimpanzees As the climate grew increasingly arid the year divided itself into dry and wet seasons During the dry season males were forced to remain in the nearby mountain ranges because there weren't enough food in the home forest to support both males and females As a result males and females parted ways during the annual dry season These were the ancestral hominids who evolved into australopithecines Two and a half million years ago as the climate became increasingly arid the forest surrounding the lake began to break up and disappear Finally the female hominids the inhabitants of the forest at the margin of the lake were forced down to the ground They became fully terrestrial but they did not know where to find food and water Consequently females began to follow herds of Hipparion horses Later they switched to one toed horses Following these migrating horses some hominids ended up in East Asia from Africa about 2 million years ago In the same fashion some hominids later wound up in Europe In the meantime male hominids developed and acquired unique behavior As rain began to fall they went downstream to their courting ground There they beat the ground with sticks to attract and seduce mates They beat pebbles sand the bones of dead animals or anything else on the ground leaving behind piles of fractured dented and broken bones These stone debris are erroneously called Oldowan tools by archaeologists and anthropologists Rain was so important to our remote ancestors because the rain was a harbinger of the brief annual mating season They prayed for the coming of rain as the climate became arid They prayed earnestly by beating the ground with sticks in their place of courtship In due course hominids became prayers Later as rain began to fall irregularly the rain lost its foremost importance Instead the horse ascended in importance Now males prayed for the coming of the horse accompanied by their mates About 32 000 years ago Upper Palaeolithic Europeans began to pray for the coming of the horse by carving engraving and painting horses on the cave walls Painting was simply another version of prayer The same was true for language Human language was developed out of verbal prayer In this book the common thread running through the entire history of human evolution is crisply and clearly explicated The origins of construction music sculpture handicrafts painting and languages are all clarified as variations of the same theme That theme was prayer
