Engineering Environment-Mediated Multi-Agent Systems Danny Weyns, Sven A. Brueckner, Yves Demazeau, 2008-07-16

Software intensive systems are increasingly expected to deal with changing user needs and dynamic operating conditions at run time. Examples are the need for life recon gurations, management of resource variability and dealing with particular failure modes. Endowing systems with these kinds of capabilities poses severe challenges to software engineers and necessitates the development of new techniques, practices and tools that build upon sound engineering principles. The field of multi agent systems focuses on the foundations and engineering of systems that consists of a network of autonomous entities, agents that interact to achieve the system goals. One line of research in multi agent systems inspired by biological, physical and other naturally occurring systems concerns multi agent systems in which agents share information and coordinate their behavior through a shared medium called an agent environment. Typical examples are gradient fields and digital pheromones that guide agents in their local context and as such facilitate the coordination of a community of agents. Since environment mediation in multi agent systems has shown to result in manageable solutions with very adaptable qualities, it is a promising paradigm to deal with the increasing complexity and dynamism of distributed applications. Control in environment mediated multi agent systems is decentralized, i.e. none of the components has full access or control over the system. Self organization is an approach to engineer decentralized, distributed and resource limited systems

that are capable of dynamically adapting to changing conditions and requirements without external intervention. This useful system property is often reflected in functions such as self configuration, self optimization and self healing. Engineering approaches to self organizing systems often rely on global functionality to emerge from local and autonomous decisions of individual agents that communicate through a shared agent environment. *Encyclopedia on Ad Hoc and Ubiquitous Computing* Dharma P.

Agrawal, Dr. Bin Xie, 2010. Ad hoc and ubiquitous computing technologies have received extensive attention in both the academia and industry with the explosive growth of wireless communication devices. These technologies are beneficial for many applications such as offering futuristic high bandwidth access for users and are expected to offer more exciting and efficient services anytime and anywhere. In order to satisfy these diverse applications, the design issues of various wireless networks such as ad hoc sensor and mesh networks are extremely complicated and there are a number of technique challenges that need to be explored involving every layer of the OSI protocol stack. This book aims to provide a complete understanding of these networks by investigating the evolution of ad hoc sensor and mesh networking technologies from theoretic concept to implementation, protocols from fundamentals to real applications. It provides the necessary background material needed to go deeper into the subject and explore the research literature. The explanation in the book is therefore sufficiently detailed to serve as a comprehensive reference for students, instructors, researchers, engineers and other professionals building their understanding of these networks.
