Theory and Practice of Geophysical Survey Design Thomas M. Davis, 1974 A theory for designing parallel track type geophysical surveys as well as the necessary numerical algorithms for implementing this theory is developed which is easily applied to many different sampling problems Within this context survey design consists of defining the appropriate track spacing track direction and down track sampling rate which will produce a set of discrete digital measurements describing the environment to a predetermined accuracy Several practical applications are presented to illustrate the adaptability of the theory

Theory of Sample Surveys M. Thompson, 1997-08-01 Following the chronological development of sample surveys this book provides an analysis of the mathematical and statistical theory of the subject The text begins with the mathematics of randomized sampling designs as well as a general treatment of estimation of population totals through the Horvitz Thompson estimator and its variants The book then examines approximations and limit theorems for the distribution of the estimators and design based estimation of other population quantities It concludes with chapters concerning inference from surveys Theory of Sample Surveys will assist in a range of applications including auditing quality monitoring market research wildlife surveys mining exploration agriculture and business surveys population health studies This book acts as an exceptional resource for survey methodologists in government organizations as well as lecturers and graduate students in statistics and biostatistics
