

RADIATION CHEMISTRY

GENERAL INTRODUCTION

BY T. S. DANTON

Chemistry Department, The University, Leeds 2

The absorption by matter of electro-magnetic radiation in the wavelength range 2000-7000 Å is generally a simple process. The destruction of the energy quantum occurs in a single act involving the quantum and the absorbing molecule only, and is governed by well-recognized laws. The absorption is selective, the primary products of the absorption process can often be identified unambiguously, and are found to be of similar reactivity, and their rate of formation and spatial distribution can usually be specified with some exactness and certainty.

In these respects the primary photochemical act differs completely from the primary act in chemical reactions which are induced by the absorption of high energy quanta (say radiation $\lambda < 50 \text{ Å}$) or by the slowing down of rapidly moving charged and uncharged particles of atomic and subatomic nature. The mechanism of energy transfer from the radiation or the particles is complex, selective and imperfectly understood; it is not possible to make anything more than very approximate and qualitative predictions as to the number, nature and initial and final distribution of the entities formed in the primary process. Moreover, in the most important reaction medium, namely water, reactions initiated by one of the particles of the primary act may be reversed by one of the others. Despite the fact that at the turn of the century the development of radiation chemistry was comparable with that of photochemistry, the present status of the former subject is similar to that of photochemistry 30 years ago. At the present time the most useful conclusions as to the primary act are still obtained by inference from the nature of the ultimate products. The last few years have seen a considerable strengthening of this nexus due primarily to a greater understanding of the chemistry of free radicals and unstable ions, and it now seems that species of this kind must be intermediary between reactants and products.

The main purpose of this Discussion, which is the first to be held on this subject by the Faraday Society, is therefore to appraise the present position, to attempt what synthesis is possible of the views of the physicists, chemists and biologists who, for varying reasons, have contributed ideas and methods to the subject, and to suggest future lines of development. In the first three papers, the authors summarize some of the current ideas concerning the physical processes involved in the formation of the primary products. The lacunae in our knowledge of the mechanism of energy loss by fast charged particles are emphasized by Professor Spiers. We are still ignorant of the W values (i.e. energy required for creation of one ion pair) for liquids, and of the relation of the ionization potentials of the isolated molecules, which gain energy by inelastic collisions with the impinging particle, to this quantity W and the empirical quantity, the mean excitation potential \bar{E} which is employed in the Bethe theory in its original and modified forms. Nevertheless we do know in qualitative terms how the mean ion density of commonly-used radiations varies with the energy, mass and atomic number of the fast particle. The conclusions reached here are still the foundations on which are erected all hypotheses concerning the dependence of the reaction product in both

Kennedy,1949 Introduction to Radiochemistry BY Gerharf Friedlander PREFACE An increasing number of universities are offering courses in radioactivity for chemists Very likely many teachers and stu dents in these courses feel as we do that there has been no suitable textbook for this purpose There is the very excellent Manual of Radioactivity by G Hevesy and F A Paneth however advances in the science since its last edition in 1938 have been more than any authors should have to expect in one decade Moreover no recent book on the subject has been written specifically for chem ists We have tried to prepare a textbook for an introductory course in the broad field of radiochemistry at the graduate or senior undergraduate level taking into account the degree of pre vious preparation in physics ordinarily possessed by chemistry students at that level We would like to offer definitions of terms including radio chemistry nuclear chemistry tracer chemistry and radiation chemistry that are heard increasingly today Unfortunately the meanings of some of these vary from laboratory to laboratory and they are hardly used concisely at all By one group nuclear chem istry is used to mean all applications of chemistry and nuclear physics to each other including stable isotope applications How ever to our minds nuclear chemistry emphasizes the reactions of nuclei and the properties of resulting nuclear species just as organic chemistry is concerned with reactions and properties of organic compounds We think of tracer chemistry as the field of chemical studies made with the use of isotopic tracers including studies of the essentially pure tracers at extremely low concen trations In the title of this book we have meant the term radio chemistry to include all the fields just described but to exclude stable isotope tracer applications Radiation chemistry which is not discussed in this text deals with the chemical effects produced by nuclear and other like radiations and although it involves some of the phenomena of radiochemistry it is really closely related to photochemistry Some comments on the order in which the subject matter is presented are perhaps appropriate We believe that the sequence of chapters after chapter VI is the logical one the order of presen tation of the material of the first five chapters is much more nearly a matter of individual choice Our plan which we have found quite teachable is to use the historical background as a brief introduction to the concepts and terminology this makes the going much easier in the succeeding topics Chapter V actually follows logically after chapter I and nothing in the arrangement of the material prevents its introduction there if preferred but we feel that it is more effective first to present further descriptive information about atomic nuclei and nuclear reactions than to confront the student at this point with the quantitative treatment of growth and decay processes The

development of the subject matter in this book has grown out of an introductory course in radiochemistry first given in the informal Los Alamos University in the latter part of 1945 by the authors principally G F with the help of Drs R W Dodson and A C Wahl and offered each year since in the Department of Chemistry at Washington University St Louis by one of us J W K
