

RADIATION CONTAMINATION VERSUS EXPOSURE

EXTERNAL CONTAMINATION

External contamination occurs when radioactive material comes into contact with a person's skin, hair, or clothing.

INTERNAL CONTAMINATION

Internal contamination can occur when radioactive material is swallowed or breathed in.

Internal contamination can also occur when radioactive material enters the body through an open wound.

Different radioactive materials can accumulate in different body organs.

RADIATION EXPOSURE

Another word for radiation exposure is irradiation.

Radioactive materials give off a form of energy that travels in waves or particles.

When a person is exposed to certain types of radiation, the energy may penetrate the body.

A person exposed to radiation is not necessarily contaminated with radioactive material.

For a person to be contaminated, radioactive material must be on or inside of his or her body.

When a person has an x-ray, he or she is exposed to radiation but is not contaminated.

Radioactive Contamination:

Radiological Contamination in the United States United States. Congress. Senate. Committee on Governmental Affairs, 1993 **Radioactive Contamination** Virginia Brodine, 1975 **Airborne Radioactive Contamination in Inhabited Areas** , 2009-08-14 For many decades investigations of the behaviour and implications of radioactive contamination in the environment have focused on agricultural areas and food production This was due to the erroneous assumption that the consequences of credible contaminating incidents would be restricted to rural areas However due to the Chernobyl accident more than 250 000 persons were removed from their homes demonstrating a great need for knowledge and instruments that could be applied to minimise the manifold adverse consequences of contamination in inhabited areas Also today the world is facing a number of new threats including radiological terrorism which would be likely to take place in a city where most people would become directly affected A recent report from the US Commission on the Prevention of Weapons of Mass Destruction Proliferation and Terrorism concludes that it is most likely that a large radiological or even nuclear terror attack on a major city somewhere in the world will occur before 2013 For the first time ever the specific problems of airborne radioactive contamination in inhabited areas are treated in a holistically covering treatise pinpointing factorial interdependencies and describing instruments for mitigation The state of the art knowledge is here explained in *Airborne Radioactive Contamination in Inhabited Areas* y leading scientists in the various disciplines of relevance Unique holistic description of airborne radioactive contamination of inhabited areas and its consequences State of the art information on problems associated with both accidental and malicious contamination events in particularly dirty bombs Detailed description of processes and parameters governing the severity of contaminating incidents Written by key experts in the world Radioactive Contamination of the Tokyo Metropolitan Area Hideo Yamazaki, 2020-10-09 This book presents the 5 year monitoring of radioactive contamination in the Tokyo metropolitan area due to the Fukushima accident covering radiation monitoring of soil litter river water seawater aquatic sediments fish and shellfish and plants in urban areas Based on spatial and temporal data it evaluates the environmental radiation contamination of the Tokyo metropolitan following the first nuclear accident affecting an urban area since Chernobyl Since little is known about the contamination in Kiev city this data is particularly valuable offering insights into the dynamics of radioactive contamination in metropolitan areas which are of interest in relation to the behavior of radionuclides resulting not only from nuclear accidents but also from nuclear terrorism As such this book will be appeal to nuclear and radiation experts environmental administration professionals and specialists in environmental protection groups as well as student and academics in the related fields **Handbook of Radioactive Contamination and Decontamination** J. Severa, J. Bár, 1991-12-04 The objective of this book is to present a comprehensive picture first of the fundamentals of general contamination of solid surfaces and water and in the second part to review the main practical procedures and means of applied decontamination used in the fields of activity The most

emphasis on radioactive contamination deals with decontamination of the operational facilities in nuclear power plants Other special decontamination branches of current interest are also dealt with briefly The art of decontamination is being enriched by the progress achieved in relevant scientific disciplines and employs these relative advances The current volume discusses in detail the following trends in decontamination Firstly the development and use of new decontamination methods that are highly efficient non aggressive to decontaminated materials and economically feasible secondly the utilization of progressive elements of automation and robotics thirdly the development and use of such decontamination formulations that would minimize the volume of wastes and would produce wastes in a form in which they could be either easily further treated or safely disposed of without risk to human health or the environment finally the choice of suitable materials used both for the structural and the technological parts of nuclear installations with regard to their minimal contaminability and ease of decontamination

Cleaning Up Sites Contaminated with Radioactive Materials Russian Academy of Sciences, National Research Council, Policy and Global Affairs, Development, Security, and Cooperation, Office for Central Europe and Eurasia, Committee on Cleaning Up of Radioactive Contamination: Russian Challenges and U.S. Experience, 2009-02-23 This publication features papers presented at the Workshop on Cleaning Up Sites Contaminated with Radioactive Materials held in Moscow in June 2007 This activity was organized by the National Academies in cooperation with the Russian Academy of Sciences and with funding provided by the Russell Family Foundation The workshop was designed to promote exchanges of information on specific contaminated sites in Russia and elsewhere and to stimulate greater attention to the severity of the problems and the urgent need to clean up sites of concern to the local and international communities

Radioactive Fallout after Nuclear Explosions and Accidents Y.A. Izrael, 2002-06-20 To achieve successful solutions to the problems resulting from local distant and global radioactive fallout after nuclear explosions and accidents and to achieve successful retrospective analyses of the radiation conditions from recent observations certain information is needed the distribution of the exposure dose rate in the atmosphere and in a country the distribution of radionuclides in natural environments and the nuclide composition of the radioactive fallout the features of formation of the aerosol particle carriers of the radioactivity and of the nuclide distribution of the particles of different sizes formed under different conditions the processes involved in the migration of radioactive products in different zones and environments the external and internal effects of nuclear radiation on human beings This monograph is devoted to a number of these problems namely to studies of the radioactive fallout composition the formation of the aerosol particles that transport the radioactive products and to the analysis of the external radiation doses resulting from nuclear explosions and or accidents Problems of restoration and rehabilitation of contaminated land areas are also touched upon in the monograph To solve such problems one requires knowledge of the mobility of radionuclides an understanding of their uptake by plants their transportation within the food chain and finally their uptake by animal and or human organisms The results of many years of

study of radioactive fallout from atmospheric and underground nuclear explosions and accidents are summarized in this book. It is intended for various specialists: geophysicists, ecologists, health experts and inspectors as well as those who are concerned with radioactive contamination of natural environments. It deals with all the major subjects in the field ranging from the chemistry of the solar system to environmental geochemistry. The Treatise on Geochemistry has drawn on the expertise of outstanding scientists throughout the world creating the reference work in geochemistry for the next decade. Each volume consists of fifteen to twenty-five chapters written by recognized authorities in their fields and chosen by the Volume Editors in consultation with the Executive Editors. Particular emphasis has been placed on integrating the subject matter of the individual chapters and volumes. Elsevier also offers the Treatise on Geochemistry in electronic format via the online platform ScienceDirect, the most comprehensive database of academic research on the Internet today enhanced by a suite of sophisticated linking, searching and retrieval tools. Commission. Division of Technical Information, 1967 **Air Pollution in the Ural Mountains** Igor Linkov, R. Wilson, 2012-12-06 Mankind has created pollution and has suffered its consequences since time immemorial. This has intensified greatly since the industrial revolution. One of the main problems in society and a major function of government is how to cope with this pollution. 80 years ago the maxim used to be the solution to pollution is dilution: to dilute any polluted water supply in a large river or to build a tall chimney stack to dilute air pollutants into the air so that concentrations of pollutants are always low. Since 1950 western countries have gone further and made major attempts to reduce the emissions of the most important pollutants. The discussion of what is an important pollutant has changed. To SO₂ and heavy metals such as cadmium or arsenic we now add fine particles and even when we discuss global climate change CO₂. The experience and practice of the western countries was only partly followed in the USSR although the switch from use of coal to natural gas in major cities around 1970 was very important. Since the collapse of the USSR it has become fashionable both in the west and inside Russia to blame all society's ills on pollution. The statistics do not bear out that conclusion but pollution remains an important issue which can be reduced without significant detriment to other societal values.
