L'ARGENT Émile Zola, 2023-08-26. L'Argent est un roman écrit par Émile Zola, un écrivain français du XIX^e siècle et l'un des principaux représentants du mouvement littéraire naturaliste. Voici un résumé de l'œuvre. L'Argent fait partie de la série Les Rougon-Macquart de Zola, qui explore les différentes branches d'une famille à travers plusieurs romans. Ce roman se concentre sur l'ascension et la chute de la famille Rougon dans le monde des affaires et de la finance à Paris pendant le Second Empire. L'histoire suit principalement les personnages d'Aristide Saccard et de sa femme Renée, qui sont obsédés par l'accumulation de richesse et de pouvoir. Saccard est un homme d'affaires sans scrupules prêt à utiliser la spéculation financière pour atteindre ses objectifs, tandis que Renée est une femme séduisante et futile attirée par le luxe et les plaisirs de la haute société. Le roman explore les thèmes de l'argent, de la spéculation, de la corruption et de la décadence morale. Il décrit comment l'obsession pour l'argent mène à des comportements destructeurs et à une course effrénée vers la richesse. L'intrigue se déroule dans le contexte du krach financier de 1867 et met en lumière les conséquences désastreuses de la spéculation sur la vie des personnages. L'Argent est une critique acerbe de la société bourgeoise et du culte de l'argent, qui prouvaient l'époque. Zola examine les motivations et les actions des personnages à travers le prisme de la vision naturaliste, en mettant en avant les influences de l'environnement social et économique sur leur destin.

An Algebraic Introduction to Complex Projective Geometry Christian Peskine, 1983. In this introduction to commutative algebra, the author chooses a route that leads the reader through the essential ideas without getting embroiled in technicalities. He takes the reader quickly to the fundamentals of complex projective geometry, requiring only a basic knowledge of linear and multilinear algebra and some elementary group theory. The author divides the book into three parts. In the first, he develops the general theory of Noetherian rings and modules. He includes a certain amount of homological algebra and emphasizes rings and modules of fractions as preparation for working with sheaves. In the second part, he discusses polynomial rings in several variables with coefficients in the field of complex numbers. After Noether's normalization lemma and Hilbert's Nullstellensatz, the author introduces affine complex schemes and their morphisms; he then proves Zariski's main theorem and Chevalley's semi-continuity theorem. Finally, the author's detailed study of Weil and Cartier divisors provides a solid background for modern intersection theory. This is an excellent textbook for those who seek an efficient and rapid introduction to the geometric applications of commutative algebra.
