The European Network for the development of Advanced Models to interpret Optical Remote Sensing data over terrestrial environments, ENAMORS, is a consortium of academic and research institutions involved in methodological research and in applications of remote sensing techniques for Earth Observation. It was supported initially through a Concerted Action from the Environment and Climate Research and Technology Development Program in the 4th Framework Program of the European Commission. Its activities include the organization of international scientific conferences, the first of which took place in Tuusula, Finland, from September 17 to 19, 1997. This book contains the proceedings of that conference and effectively summarizes the discussions and conclusions reached by the participants. The title of this meeting was Optical Remote Sensing of Terrestrial Surfaces: New Sensors, Advanced Algorithms and the Opportunity for Novel Applications. It aimed at assembling representatives from the policy maker, remote sensing research and end user communities as well as from national and international space agencies and aerospace industries. Together they discussed the need for R & D support as well as the contents and priorities of such a program in this economic sector during the period covered by the 5th Framework Program, 1999-2002. **GNSS**

**Monitoring of the Terrestrial Environment** Yosuke Aoki, Corné Kreemer, 2024-07-31 GNSS Monitoring of the Terrestrial Environment: Earthquakes, Volcanoes and Climate Change presents the application of GNSS technologies to natural hazards on Earth. The book details the background theory of the GNSS techniques discussed and takes the reader through applications and implementation. Tables comparing GNSS with other geodetic techniques such as SAR, VLBI, SLR and conventional geodetic methods such as strainmeters, tiltmeters and leveling surveys are also included. The book concludes with a chapter bridging both parts, discussing the relationship between earthquakes, volcanism and climate change. The book is aimed at academics, researchers and advanced students working in the fields of remote sensing technologies or natural hazards. It is divided into two parts, with the first covering the monitoring of earthquakes, volcanoes and applications of GNSS.

signals to better understand earthquakes and volcanism while the second part covers monitoring climate change with GNSS Provides a detailed focus on the utility of GNSS technologies for dealing with natural hazards Details theory and applications of GNSS to natural hazards allowing readers to develop a thorough understanding on the theoretical background as well as practical applications Covers the latest developments in the field along with future perspectives as GNSS technologies are expected to evolve

*Computer Processing of Remotely-Sensed Images* Paul M. Mather, Magaly Koch, 2022-04-11 Computer Processing of Remotely Sensed Images A thorough introduction to computer processing of remotely sensed images processing methods and applications Remote sensing is a crucial form of measurement that allows for the gauging of an object or space without direct physical contact allowing for the assessment and recording of a target under conditions which would normally render access difficult or impossible This is done through the analysis and interpretation of electromagnetic radiation EMR that is reflected or emitted by an object surveyed and recorded by an observer or instrument that is not in contact with the target This methodology is particularly of importance in Earth observation by remote sensing wherein airborne or satellite borne instruments of EMR provide data on the planet s land seas ice and atmosphere This permits scientists to establish relationships between the measurements and the nature and distribution of phenomena on the Earth s surface or within the atmosphere Still relying on a visual and conceptual approach to the material the fifth edition of this successful textbook provides students with methods of computer processing of remotely sensed data and introduces them to environmental applications which make use of remotely sensed images The new edition s content has been rearranged to be more clearly focused on image processing methods and applications in remote sensing with new examples including material on the Copernicus missions microsatellites and recently launched SAR satellites as well as time series analysis methods The fifth edition of *Computer Processing of Remotely Sensed Images* also contains A cohesive presentation of the fundamental components of Earth observation remote sensing that is easy to understand and highly digestible Largely non technical language providing insights into more advanced topics that may be too difficult for a non mathematician to understand Illustrations and example boxes throughout the book to illustrate concepts as well as revised examples that reflect the latest information References and links to the most up to date online and open access sources used by students *Computer Processing of Remotely Sensed Images* is a highly insightful textbook for advanced undergraduates and postgraduate students taking courses in remote sensing and GIS in Geography Geology and Earth Environmental Science departments
