Micro House

According to studies houses answer to a certain number of needs for a human.

- 1.Shelter
- 2.Food and Water
- 3.Sanitation
- 4.Sleep
- 5.Others(social communications)

When it comes to terms of designing micro houses, it is usual that because of lacking of space the areas that are supposed to go under the category of OTHERS such as spaces for micro scale social interaction will be diminished. Referencing to so many unsuccessful capsule housings which are inhabitable lacking the high qualities of living, we are designing plugin housing with consideration of revival of In-Between spaces named as Serendipity in this project.

People tend to define houses for dwelling based on different essential behaviours.

1. Need for Privacy
2. Need for semi-private, close relationships
3. Need for Micro scale social communications
4. Need for Mega scale social communications

The first two needs are responded by whatever happens inside the walls of a house, but the need to make familiar social interactions seem to vanish in Modern era.

Before overgrowing of mega cities and the birth of residential towers, houses were connected to the street with a coherent hierarchy of smaller streets and Alleys which was giving the dwellers an opportunity to interact with people of the neighbourhood. Meanwhile, the modern pattern of living connects the apartments vertically by different number of staircases and elevators which are in lack of rich qualities needed for **SERENDIPITY**

Intelligent Diagnosis and Prognosis of Industrial Networked Systems Chee Khiang Pang, Frank L. Lewis, Tong Heng Lee, Zhao Yang Dong, 2017-07-28 In an era of intense competition where plant operating efficiencies must be maximized downtime due to machinery failure has become more costly To cut operating costs and increase revenues industries have an urgent need to predict fault progression and remaining lifespan of industrial machines processes and systems An engineer who mounts an acoustic sensor onto a spindle motor wants to know when the ball bearings will wear out without having to halt the ongoing milling processes A scientist working on sensor networks wants to know which sensors are redundant and can be pruned off to save operational and computational overheads These scenarios illustrate a need for new and unified perspectives in system analysis and design for engineering applications Intelligent Diagnosis and Prognosis of Industrial Networked Systems proposes linear mathematical tool sets that can be applied to realistic engineering systems The book offers an overview of the fundamentals of vectors matrices and linear systems theory required for intelligent diagnosis and prognosis of industrial networked systems Building on this theory it then develops automated mathematical machineries and formal decision software tools for real world applications The book includes portable tool sets for many industrial applications including Forecasting machine tool wear in industrial cutting machines Reduction of sensors and features for industrial fault detection and isolation FDI Identification of critical resonant modes in mechatronic systems for system design of R D Probabilistic small signal stability in large scale interconnected power systems Discrete event command and control for military applications The book also proposes future directions for intelligent diagnosis and prognosis in energy efficient manufacturing life cycle assessment and systems of systems architecture Written in a concise and accessible style it presents tools that are mathematically rigorous but not involved Bridging academia research and industry this reference supplies the know how for engineers and managers making decisions about equipment maintenance as well as researchers and students in the field

Servomechanism Analysis George Julius Thaler,Robert George Brown,1953 **Analysis of an Electrohydraulic Aircraft Control-surface Servo and Comparison with Test Results** John W. Edwards,1972 An analysis of an electrohydraulic aircraft control surface system is made in which the system is modeled as a lumped two mass spring coupled system controlled by a servo valve Both linear and nonlinear models are developed and the effects of hinge moment loading are included Transfer functions of the system and approximate literal factors of the transfer functions for several cases are presented The damping action of dynamic pressure feedback is analyzed Comparisons of the model responses with results from tests made on a highly resonant rudder control surface servo indicate the adequacy of the model The effects of variations in hinge moment loading are illustrated *Design and Analysis of Relay Servo Systems* Thomas Oliver Duff,1954
