Molecular Control Of Haemopoiesis:

Molecular Control of Haemopoiesis Gregory R. Bock, Joan Marsh, 2008-04-30 The many different kinds of blood cells found in the human body are derived from multi potential stem cells which are induced to differentiate into one or another cell type by the action of regulatory proteins or growth factors This volume looks at the way that binding of these proteins to specific receptors causes changes in gene expression in the nucleus and the activity of certain enzymes in the cytoplasm committing the cell to a particular developmental pathway Also discussed are recently established clinical applications and clinical trials of new techniques

The Molecular Control of Blood Cells Donald Metcalf, 1990 *The Molecular Control of Blood Cells* Donald Metcalf, 1988 This book presents a masterful overview of the mechanics of blood cell formation and the factors that control blood cell growth Cells circulating in the blood perform functions essential for the survival of organisms yet blood cells and associated blood cell forming hemopoietic tissues have certain features that make them quite different from other vital organs in the body These features include the short life span of mature blood cells the multiplicity of blood cell types and the wide dispersion of hemopoietic tissue in the body The regulation of hemopoiesis in response to emergencies such as blood loss or infections is an exceedingly complex process However our knowledge of hemopoietic growth factors known generally as colony stimulating factors or CSFs has made exciting advances in recent years This book provides a leading authority's review of the purification and cloning of CSFs and their actions in regulating white blood cell production in the body Donald Metcalf also examines the role of CSFs in controlling resistance to infections and in the initiation and suppression of myeloid leukemia Metcalf's involvement at the center of this research from its inception to the present day enables him to give a historical view as well as a lucid summary of recent research In addition he addresses the broader question of the relation between growth control and cancer development This excellent synopsis should be of particular interest to hematologists virologists general clinicians and medical students

Hemopoietic Growth Factors and Mononuclear Phagocytes R. van Furth, 1993-03-03 Free Radical Toxicology Kendall B Wallace, 1997-06-19 Provides insight into the involvement of free radicals in the pathogenesis of chemical induced toxic tissue injury The text addresses the fundamentals of free radical chemistry and the theoretical basis for electron transfer reaction leading to free radical generation It describes the various subcellular sources of free radicals the biological reactivity with lipid protein and nucleic acids and the physiochemical determinants of free radical induced cell injury and the various antioxidant defence systems The book focuses on target organ toxicity and the concluding section offers an overview of the evidence implicating free radicals in the aetiology of various chemical toxicities challenging the possibility of misguided use of biomarkers for oxidative damage

Hematopoiesis Leonard I. Zon, 2001-04-12 Hematopoiesis or the process of blood formation has been extensively studied at both basic and clinical levels Human diseases such as thalassemia immunodeficiency and leukemia represent defects in this process Approaches to treat these disorders have required a basic understanding of the biology of

blood cells For instance hemopoietic stem cell replacement or bone marrow transplantation has been used to ameliorate disease This volume focuses on hematopoiesis at a cellular and molecular level and establishes the basis for clinical manipulation of hematopoietic cells for therapeutic benefit In Part I the cellular characteristics of progenitors and stem cells are explored Emphasis is placed on purification of stem cells and both in vitro and in vivo assays The regulation of normal and leukemia stem cells is illustrated An excellent discussion of potential use of these cells for gene therapy concludes this section Hemapoiesis is easily studied during embryogenesis Part II develops the concept of the waves of hemapoiesis during development Comparative hematology is making a major comeback as a field in the 1990 s One hope is that general principles of hematopoiesis will be established by studying many models and systems Part III delves into critical factors that regulate hematopoiesis including both intracellular and extracellular signals Part IV and V describe lineage programs for myeloid and lymphoid lineages These chapters are meant to be illustrative of the different cell fates but are not exhaustive Part VI examines the genetics of hematopoiesis particularly in animal models The hematopoietic system is in constant contact with stromal cells and endothelial cells during development and in the adult Evidence suggests that endothelial cells and blood cells may arise from a common progenitor the hemangioblast Part VII and VIII discuss the stromal and endothelial cells with the emphasis on their interaction with hematopoietic cells

The Jak-Stat Pathway in Hematopoiesis and Disease Alister C. Ward, 2002-12-31 This book for the first time comprehensively surveys the research investigating the Jak Stat pathway and its role in normal blood development as well as its perturbation in disease It draws on the expertise of world renowned medical researchers to take the reader from basic biology through to recent therapeutic advances

The Hemopoietic Colony-stimulating Factors Donald Metcalf, Nicos Nicola, 1995-02-24 A detailed account for cell biologists and clinicians of the colony stimulating factors

Humoral Factors in the Regulation of Tissue Growth Piero P. Foa, 2012-12-06 Experts in the field of endocrinology as well as ophthalmologists oncologists orthopedists and oral surgeons discuss the nature and mechanism of action of growth stimulating substances whose biological and clinical activities in humans have been demonstrated or are being investigated The monograph represents a good sampler of current basic and applied knowledge in the field

Handbook of Growth Factors Enrique Pimentel, 1994-06-02 Handbook of Growth Factors Volume III is devoted to hematopoiesis and its regulation by endogenous factors with growth stimulatory and growth inhibitory properties The book provides detailed discussions on signaling agents related to the regulation of hematopoiesis including the interleukins the colony stimulating factors the interferons the tumor necrosis factors the erythropoietic growth factors the platelet derived growth factor the leukemia inhibitory factor and the transferrins The structure and function of

each factor is covered in detail as well as its receptor and postreceptor mechanism of action and its possible role in neoplastic processes The book also explores the present state of the knowledge about megakaryocyte growth factors and macrophage derived growth factors Current Catalog National Library of Medicine (U.S.), First multi year cumulation covers six years 1965 70 *Pharmaceutical Applications of Cell and Tissue Culture to Drug Transport* Glynn Wilson,S.S. Davis,L. Illum,Alain Zweibaum,2012-12-06 In recent years there have been rapid advances in the growth and differentiation of mammalian cells in culture This has led to increasing use of such in vitro systems in a wide variety of studies on fundamental aspects of cell structure and function including normal growth and metabolism mechanisms of differentiation and oncogenesis mechanisms of protein and membrane synthesis and cell polarity Recent advances in our ability to grow cells including human cells on permeable supports to generate confluent cellular barriers with the morphological polarity corresponding to their in vivo counterparts has greatly facilitated such studies In particular these new techniques have led to an increasing interest in the use of cell and tissue culture systems as a means for examining the transport of drugs across epithelial and endothelial barriers An obvious question is whether these new in vitro methodologies will provide convenient systems that can substitute for and replace animal models Various research groups both in academia and in the pharmaceutical industry have been investigating these types of methodologies in order to develop convenient well characterized systems that can be used to examine basic aspects of transcellular transport and to evaluate the permeability of drug molecules and delivery systems Of particular note is use of confluent cell layers to study the transport of large molecules such as peptides and proteins produced through recombinant DNA technology **Stem Cells: From Basic Research to Therapy, Volume 1** Federico Calegari,Claudia Waskow,2014-02-07 The first volume of Stem Cells deals with the fundamental principles that govern embryonic and somatic stem cell biology Historically the identification and characterization of such pathways and general rules of stemness occurred during embryonic development and Volume I reflects this with topics spanning cell cycle regulation epigenetics and a **Peripheral Blood Stem Cell Autografts** Eckart W. Wunder,Philippe R. Henon,2012-12-06 The monograph edited by Drs Wunder and Henon on Peripheral Blood Stem Cell Autografts is extremely useful as well as timely It covers the state of the arts with respect to the use of hemopoietic stem cells collected from the peripheral blood for the reconstitution of hematopoiesis after myeloablative therapy If it is accepted that hematopoietic function in the mammalian organism is the result of stem cell seeding of an appropriate stromal matrix then the use of blood derived stem cells for hematopoietic reconstitution represents the physiological form of the re establishment of a hematopoietic bone marrow All observations to date are compatible with the assumption that stem cells migrate via the blood stream from extraembryonic hematopoietic tissue to the fetal liver to establish there a first intraembryonic site of blood cell formation and especially of stem cell replication and proliferation This fetal liver tissue appears then to be the major source for the seeding of fetal bone marrow stroma as it develops sequentially in all the bones of

the skeleton in other words during most of the entire embryonic development There is a very high concentration of stem cells in the blood of the embryo more than 20000 CFU GM per ml in the 22nd week and the stem cells in cord blood seem to be the tail end of a dramatic stem cell traffic in the embryo to establish the hemopoietic as well as lymphopoietic tissue

Polyfunctional Cytokines Gregory R. Bock,Joan Marsh,Kate Widdows,2008-04-30 Experts from a variety of areas compare and discuss IL 6 and LIF in order to provide a new understanding of their modes of action the significance of their polyfunctionalization why the body chooses to use one molecule to regulate various cell types and their functional overlap Covers such topics as actions of IL 6 and LIF on lymphoid populations on megakaryocyte and platelet production on bone metabolism their effects on leukemic cells and much more Includes contributions from researchers working on a variety of cell types and organ systems along with potential clinical applications regarding these two factors Research Awards
