

An aerial photograph of a wetland landscape. The image shows a large, irregularly shaped body of water in the upper half, surrounded by green vegetation. In the lower half, there are smaller, more fragmented water bodies and patches of brownish-yellow land, possibly indicating different types of wetland or areas of degradation. The text is overlaid in the center of the image.

Remote Sensing For Wetland Monitoring:

Remote Sensing for Wetland Monitoring & Waterfowl Habitat Management Ketan Tatu, Jai Singh Parihar, M. M. Kimothi, 1999 *Remote Sensing of Wetlands* Ralph W. Tiner, Megan W. Lang, Victor V. Klemas, 2015-03-23 Effectively Manage Wetland Resources Using the Best Available Remote Sensing Techniques Utilizing top scientists in the wetland classification and mapping field Remote Sensing of Wetlands Applications and Advances covers the rapidly changing landscape of wetlands and describes the latest advances in remote sensing that have taken place over the past Wetlands Detection Methods Investigation K. H. Lee, 1991 The purpose of this investigation was to research and document the application of remote sensing technology to wetland detection and mapping Various remote sensing sensors and platforms are evaluated 1 for suitability to monitor specific wetlands systems 2 for their effectiveness in detailing the extent of wetlands 3 for their capability to monitor changes and 4 for the resulting relative cost benefits of implementing and updating wetlands databases The environment to be monitored consists of physiographic and ecological wetland resources affected directly or indirectly by anthropogenic activity Air craft and satellite remote sensing can be used to record and assess the condition of these resources Monitoring of environmental conditions is based on the observation and interpretation of certain landscape features Although some forms of monitoring are continuous resource monitoring from aircraft and satellite platforms is periodic in nature with change being documented through a series of observations over a given span of time This report summarizes the findings of a bibliographic search on the methods used to inventory and or detect changes in wetland environments The bibliography contains numerous citations and is not intended to be all inclusive Books major journals and symposium proceedings were examined The findings documented will provide the potential user with a basic understanding of remote sensing technology as it is applied to wetland monitoring and trend analysis *Use of Remote Sensing and GIS for Wetland Monitoring and Assessment* Daniel Rokitnicki-Wojcik, Patricia Chow-Fraser, 2009 Remote Sensing of Wetlands in Yellowstone National Park Christopher Kevin Wright, 2004 As part of the Amphibian Research and Monitoring Initiative satellite remote sensing was used to identify potential wetland amphibian habitat in Yellowstone National Park Landsat Thematic Mapper imagery was combined with ancillary predictors of wetland occurrence including habitat type cover type landform type bedrock geology soil attributes terrain measures and climate data Classification trees were used to predict the likelihood of palustrine wetland occurrence across the Yellowstone landscape Wetland maps generated by this study are intended to address shortcomings of the National Wetland Inventory in Yellowstone namely errors of omission and the temporally invariant nature of the inventory Relative importance of Thematic Mapper imagery image texture information terrain measures and thematic spatial data were assessed by comparing the accuracy of classification trees trained with different subsets of predictors In general classification trees using all available predictors exhibited the greatest accuracy Classification tree structure was similar in models generated with satellite imagery from different years Also similar accuracy

rates were found across years The results indicate that the method could be applied to annual wetland monitoring Average producer s accuracy for the palustrine wetland class was approximately 0.92 Five palustrine wetland classes were discriminated with an average overall accuracy of approximately 0.83 A wetland map derived from a 1 August 2003 Thematic Mapper image was field verified in late summer and early autumn of 2003 The classification tree methodology appears to be sensitive to within season wetland condition and yearly wetland variability Satellite remote sensing located wetlands not mapped by the National Wetland Inventory and also identified upland sites erroneously classified as wetland Methods developed by this study are general enough to be applied in other physiographic settings and should prove to be useful to amphibian conservation efforts over large geographic extents

Remote Sensing Applications in Monitoring of

Protected Areas Yeqiao Wang ,Zhong Lu,Yongwei Sheng,Yuyu Zhou,2020-12-02 Remote sensing has been successfully applied in monitoring of protected areas around the world With intensified impacts of climate and environmental change protected areas become increasingly important to serve as indicators of and buffers against the impacts of the disturbances Remote sensing plays an irreplaceable role in this frontline of challenges The subjects and contents of the articles collected in this book reflect the state of the art applications of remote sensing for capturing dynamics of environmental and ecological variations of the protected areas The examples include revealing the level growth rate trend and distribution pattern of the night time light of global protected areas quantifying the energy budget water cycle and carbon sink over the Three River Headwaters Region in the hinterland of the Tibetan Plateau monitoring wetland change in a cross boundary zone between Northeast China and the Russian Far East and monitoring applications and change analyses in protected areas of boreal forests dryland shrubs coastal salt marshes large lakes and temperate semi humid to semi arid transitional agricultural regions using a variety of sensor data with innovative approaches Also included in this collection is a bibliometric analysis that suggests the intellectual structure in remote sensing of protected areas from the perspective of journal publications

Combination of Optical and SAR Remote Sensing Data for Wetland Mapping and Monitoring Meisam Amani,2018

Wetlands provide many services to the environment and humans They play a pivotal role in water quality climate change as well as carbon and hydrological cycles Wetlands are environmental health indicators because of their contributions to plant and animal habitats While a large portion of Newfoundland and Labrador NL is covered by wetlands no significant efforts had been conducted to identify and monitor these valuable environments when I initiated this project At that time there were only two small areas in NL that had been classified using basic Remote Sensing RS methods with low accuracies There was an immediate need to develop new methods for conserving and managing these vital resources using up to date maps of wetland distributions In this thesis object and pixel based classification methods were compared to show the high potential of the former method when medium or high spatial resolution imagery were used to classify wetlands The maps produced using several classification algorithms were also compared to select the optimum classifier for future experiments Moreover a

novel Multiple Classifier System MCS which combined several algorithms was proposed to increase the classification accuracy of complex and similar land covers such as wetlands Landsat 8 images captured in different months were also investigated to select the time for which wetlands had the highest separability using the Random Forest RF algorithm Additionally various spectral polarimetric texture and ratio features extracted from multi source optical and Synthetic Aperture Radar SAR data were assessed to select the most effective features for discriminating wetland classes The methods developed during this dissertation were validated in five study areas to show their effectiveness Finally in collaboration with a team a website <http://nlwetlands.ca> and a software package were developed named the Advanced Remote Sensing Lab ARSeL to automatically preprocess optical SAR data and classify wetlands using advanced algorithms In summary the outputs of this work are promising and can be incorporated into future studies related to wetlands The province can also benefit from the results in many ways
